"*Conservation, Capitalism and the Future of Protected Areas*" Academic Press

The book covers different aspects of ecological resources with reference to conservation and management. In present times, there is a lot of concern for the ecological resources because of global warming and climate change. This book is important for all biology students, researchers and teachers at various levels to understand the concepts of ecology and ecological resources for their rational utilization need for farming strategies for the effective conservation and management of resources. A number of innovative ideas have been incorporated into the subject and these ideas need special attention in view of the rapid consumption of ecological resources without any thought for their sustainability to sustain humanity. This book is especially important for academicians, researchers, students of environmental sciences, forestry, ecology and evolution, botany, ecotourism, eco restoration, management, architecture etc.

Second Edition Metropolitan Books

Roy and Jan have assembled a timely snapshot of our current understanding of ecotourism, both as a concept worthy of scientific inquiry and as an increasingly significant segment of global commerce and industry. A terrific piece of work! Sam Ham, University of Idaho, US In the 30 or so year since it became established in the tourism literature and in tourism practice, ecotourism has attracted as many proponents as opponents. This Handbook now brings together some of the leading scholars worldwide in this field, to explore the current position of this form of tourism. In doing so, it offers serious critiques, it explores meanings and paradoxes, it offers best practices and it looks to the future. It is the Handbook for one of tourism's fastest growing and controversial sectors. David Airey, University of Surrey, UK This is a most welcome and needed book. With a very strong editorial team and contributing authors, the Handbook covers all the key issues of ecotourism. It cuts through the confusion surrounding the much-misunderstood concept of ecotourism, clearly dealing with definitions, concepts and research issues. The Handbook is particularly welcome for its focus on the visitor experience, a strength of the editors, and for clearly linking the theory of ecotourism with practice in the field. Christopher Cooper, Oxford Brookes University, UK This Handbook brings together contributions from over forty international experts in the field of ecotourism. It provides a critical review and discussion of current issues and concepts it challenges readers to consider the boundaries of what ecotourism is, and could be. The Handbook provides practical information

regarding the business of ecotourism; insights into ecotourist behaviour and visitor experiences; and reflections on the practice of ecotourism in a range of different contexts. The Handbook is designed to be a valuable reference book for tourism scholars and researchers.

Conservation Biology in Sub-Saharan Africa comprehensively explores the challenges and potential solutions to key conservation issues in Sub-Saharan Africa. Easy to read, this lucid and accessible textbook includes fifteen chapters that cover a full range of conservation topics, including threats to biodiversity, environmental laws, and protected areas management, as well as related topics such as sustainability, poverty, and human-wildlife conflict. This rich resource also includes a background discussion of what conservation biology is, a wide range of theoretical approaches to the subject, and concrete examples of conservation practice in specific African contexts. Strategies are outlined to protect biodiversity whilst promoting economic development in the region. Boxes covering specific themes written by scientists who live and work throughout the region are included in each chapter, together with recommended readings and suggested discussion topics. Each chapter also includes an extensive bibliography. Conservation Biology in Sub-Saharan Africa provides the most up-to-date study in the field. It is an essential resource, available on-line without charge, for undergraduate and graduate students, as well as a handy guide for professionals working to stop the rapid loss of biodiversity in Sub-Saharan Africa and elsewhere.

Environmental Restoration and Design for Recreation and Ecotourism Edward Elgar Publishing

Environments around the globe are undergoing human-induced change. Human population growth, rapid urbanization, expanding global economy, and the diffusion of western consumer lifestyles are placing increasing pressure on natural and social systems. Global institutions, nation-states, and local communities are seeking to identify and employ sustainable solutions to these environmental and socio-economic challenges. Sustainability has emerged as a policy discourse that seeks to balance the desire and need for economic growth with the protection of the environment, and the promotion of social and environmental justice. This book contributes to the study and search for

sustainable responses to global environmental change. The authors of this volume explore environmental change in different places around the world and the diverse responses to such changes. The chapters demonstrate the need for place-specific sustainable development; the authors suggest the need to see sustainable responses to environmental change as a negotiated outcome between various social actors living and working in diverse spatial, environmental and socio-economic contexts. Environmental Change and Sustainability is a timely international examination of the relationship between environmental change and sustainability. As an InTech open source volume, current and cutting edge research methodologies and research results are quickly published for the academic policy-making communities. Dimensions of environmental change and sustainability explored in this volume include: Natural science approaches to study of environmental change Importance of perception in human understanding of environmental change Role of external events and institutions in shaping sustainable responses to environmental change Importance of bottom-up sustainable development as key to reducing environmental risk and community vulnerability The need for place-based sustainable development that combines local conditions with global processes Creation of a sustainable development model that synthesizes local, traditional knowledge of the environment and environmental management with the techniques and understandings generated by modern environmental science

**Rewilding the World** Routledge

Wetlands are among the world's most productive environments with countless species of plants and animals, as well as humans, dependent upon them for survival. Moreover, they provide many societal benefits including water quality improvement, flood storage, shoreline erosion control, and opportunities for recreation, education, and research. The conservation of inland wetlands is thus critical, and it is vital that they are protected in situ. The Handbook of Research on Monitoring and Evaluating the Ecological Health of Wetlands highlights the challenges of wetland conservation and current scenarios of existing wetlands and their effective management. The book also promotes the inventory, assessment, and monitoring of wetlands through a discussion of practical approaches, methodologies, and techniques. The strategies covered in this book can be applied in situ, depending on the wetland in which they will be applied. It covers the most cost-effective techniques in conservation of wetland technologies and the most cutting-edge research on monitoring of wetland health and its applications. Covering topics such as forest soil, greenhouse gasses, and ecological rejuvenation, it is an ideal resource for conservators, environmentalists, executives, policymakers, government officials, professionals, researchers, academicians, and students working in ecological management and wetland conservation fields.

*Dispatches from the Conservation Revolution* Anthem Press

Around the world, ecotourism has been hailed as a panacea: a way to fund conservation and scientific research, protect fragile ecosystems, benefit communities, promote development in poor countries, instill environmental awareness and a social conscience in the travel industry, satisfy and educate discriminating tourists, and, some claim, foster world peace. Although "green" travel is being aggressively marketed as a "win-win" solution for the Third World, the environment, the tourist, and the travel industry, the reality is far more complex, as Martha Honey reports in this extraordinarily enlightening book. Ecotourism and Sustainable Development, originally published in

1998, was among the first books on the subject. For years it has defined the debate on ecotourism: Is it possible for developing nations to benefit economically from tourism while simultaneously helping to preserve pristine environments? This long-awaited second edition provides new answers to this vital question. *Ecotourism and Sustainable Development* is the most comprehensive overview of worldwide ecotourism available today, showing how both the concept and the reality have evolved over more than twenty-five years. Here Honey revisits six nations she profiled in the first edition—the Galapagos Islands, Costa Rica, Tanzania, Zanzibar, Kenya, and South Africa—and adds a fascinating new chapter on the United States. She examines the growth of ecotourism within each country's tourism strategy, its political system, and its changing economic policies. Her useful case studies highlight the economic and cultural impacts of expanding tourism on indigenous populations as well as on ecosystems. Honey is not a "travel writer." She is an award-winning journalist and reporter who lived in East Africa and Central America for nearly twenty years. Since writing the first edition of this book, she has led the International Ecotourism Society and founded a new center to lead the way to responsible ecotourism. Her experience and her expertise resonate throughout this beautifully written and highly informative book.

[Handbook of Climate Change and Biodiversity](#) Edward Elgar Publishing

A gripping account of the environmental crusade to save the world's most endangered species and landscapes—the last best hope for preserving our natural home. Scientists worldwide are warning of the looming extinction of thousands of species, from tigers and polar bears to rare flowers, birds, and insects. If the destruction continues, a third of all plants and animals could disappear by 2050—and with them earth's life-support ecosystems that provide our food, water, medicine, and natural defenses against climate change. Now Caroline Fraser offers the first definitive account of a visionary campaign to confront this crisis: rewilding. Breathtaking in scope and ambition, rewilding aims to save species by restoring habitats, reviving migration corridors, and brokering peace between people and predators. Traveling with wildlife biologists and conservationists, Fraser reports on the vast projects that are turning Europe's former Iron Curtain into a greenbelt, creating trans-frontier Peace Parks to renew elephant routes throughout Africa, and linking protected areas from the Yukon to Mexico and beyond. An inspiring story of scientific discovery and grassroots action, *Rewilding the World* offers hope for a richer, wilder future.

[Routledge International Handbook of Social and Environmental Change](#) Routledge

This handbook presents a timely, broad-ranging, and provocative overview of the essential nature of ecotourism. The chapters will both advance the existing central themes of ecotourism and provide challenging and divergent observations that will thrust ecotourism into new areas of research, policy, and practice. The volume is arranged around four key themes: sustainability, ethics and identity, change, conflict, and consumption, and environment and learning, with a total of 28 chapters. The first section focuses on sustainability as a core ecotourism criterion, with a primary focus on some of the macro sustainability issues that have an impact on ecotourism. Foremost among these topics is the linkage to the UN's Sustainable Development Goals, which have relevance to ecotourism as one of the greenest or most responsible forms of tourism. The chapters in the second section provide a range of different topics that pull ecotourism research into new directions, including a chapter on enriching indigenous ecotourism through culturally sensitive universalism.

The third section includes chapters on topics ranging from persons with disabilities as a neglected body of research in ecotourism, to ecotourism as a form of luxury consumption. The final section emphasises the link between ecotourism and learning about the natural world, including a deeply theoretical chapter on rewilding Europe. With contributions from authors around the world, this handbook gives a global platform to local voices, in both developed and emerging country contexts. The multidisciplinary and international *Routledge Handbook of Ecotourism* will be of great interest to researchers, students, and practitioners working in tourism and sustainability.

**Handbook on Resilience of Socio-Technical Systems** IGI Global

This book comprehensively describes essential research and projects on climate change and biodiversity. Moreover, it includes contributions on how to promote the climate agenda and biodiversity conservation at the local level. Climate change as a whole and global warming in particular are known to have a negative impact on biodiversity in three main ways. Firstly, increases in temperatures are detrimental to a number of organisms, especially those in sensitive habitats such as coral reefs and rainforests. Secondly, the pressures posed by a changing climate may lead to sets of responses in areas as varied as phenology, range and physiology of living organisms, often leading to changes in their lifecycles (especially but not only in reproduction), losses in productivity or even death. In some cases, the very survival of very sensitive species may be endangered. Thirdly, the impacts of climate change on biodiversity will be felt in the short term with regard to some species and ecosystems, but also in the medium and long term in many biomes. Indeed, if left unchecked, some of these impacts may be irreversible. Many individual governments, financial institutes and international donors are currently spending billions of dollars on projects addressing climate change and biodiversity, but with little coordination. Quite often, the emphasis is on adaptation efforts, with little emphasis on the connections between physio-ecological changes and the lifecycles and metabolisms of fauna and flora, or the influence of poor governance on biodiversity. As such, there is a recognized need to not only better understand the impacts of climate change on biodiversity, but to also identify, test and implement measures aimed at managing the many risks that climate change poses to fauna, flora and micro-organisms. In particular, the question of how to restore and protect ecosystems from the impact of climate change also has to be urgently addressed. This book was written to address this need. The respective papers explore matters related to the use of an ecosystem-based approach to increase local adaptation capacity, consider the significance of a protected areas network in preserving biodiversity in a changing northern European climate, and assess the impacts of climate change on specific species, including wild terrestrial animals. The book also presents a variety of case studies such as the Yellowstone to Yukon Conservation Initiative, the effects of climate change on the biodiversity of Aleppo pine forest in Senalba (Algeria), climate change and biodiversity response in the Niger Delta region, and the effects of forest fires on the biodiversity and the soil characteristics of tropical peatlands in Indonesia. This is a truly interdisciplinary publication, and will benefit all scholars, social movements, practitioners and members of governmental agencies engaged in research and/or executing projects on climate change and biodiversity around the world.

Tropical dry forests are the most exploited and endangered ecosystems in the world. A combination

of climatic and human factors often reduce these forests to patches of dry scrubs or savannas. Because these ecosystems experience a more arduous and less anticipated environment, they are more prone to environmental stress as plant communities are developed. Therefore, urgent research is necessary to understand both the detrimental issues and problem-solving approaches to conserving these important forests. The Handbook of Research on the Conservation and Restoration of Tropical Dry Forests is a pivotal reference source that combines theory and practice on the current trends and issues in this important ecological subject and discusses future challenges

towards conservation strategies of these tropical dry forests. While highlighting topics such as forest management, natural regeneration, and silviculture, this publication examines the anthropogenic impacts on tropical dry forests and the necessity to rebuild their ecosystems. This book is ideally designed for state forest agency professionals, resource managers, non-governmental organization agents, ecologists, botanists, environmentalists, students, and researchers seeking current research on the threats to these forests.
