TNM Classification of Malignant Tumours, 7th Edition provides the latest, internationally agreed-upon standards to describe and categorize cancer stages and progression. Published in affiliation with the International Union Against Cancer (UICC), this authoritative guide contains important updated organ-specific classifications that oncologists and other professionals who manage patients with cancer need to accurately classify tumours for staging, prognosis and treatment. The major alterations addressed in the 7th Edition concern carcinomas of the oesophagus and the

gastroesophageal junction, stomach, lung, appendix, biliary tract, skin, and prostate. In addition, there are several entirely new classifications:

- gastrointestinal carcinoids (neuroendocrine tumours)
- gastrointestinal stromal tumour
- upper aerodigestive mucosal melanoma
- Merkel cell carcinoma
- uterine sarcomas
- intrahepatic cholangiocarcinoma
- adrenal cortical carcinoma.

A new approach has also been adopted to separate anatomical stage groupings from prognostic groupings in which other prognostic factors are added to T, N, and M categories. These new prognostic groupings, as well as the traditional anatomical groupings, are presented for oesophageal and prostate carcinomas. Visit www.wileyanduicc.com for more

UICC Manual of Clinical Oncology

McGraw-Hill Education / Medical

There can be no doubt that a knowledge of cancer is becoming of increasing importance to doctors throughout the world. The changing patterns of disease incidence, following changes in living standards and public health services and

in medical diagnosis and treatment, reveal the importance of neoplastic disorders as causes of morbidity and mortality. If doctors are to recognise these conditions at the earliest opportunity and advise on the treatment, they must be familiar not only with clinical appearances but with the scientific principles on which the management is based. These are so important that they must be assimilated during undergraduate medical education and become an integral part of the doctor's professional equipment. The clinical study of a neoplastic disorder has usually been related to its site of appearance in the body, and its treatment has been the concern of organ- or system-specialists. This has tended to obscure the fundamental

principles of growth-disorder which are common to many varieties of tumor. A unified approach of clinical oncology can recognise common features and highlight diversity as a stimulus to further investigation. It is at the same time becoming increasingly recognised that neoplasia is a multidisciplinary problem, requiring the collaboration of many specialists: physicians, surgeons, radiotherapists, chemotherapists, pathologists, immunologists, epidemiologists, and many varieties of research worker. But the fate of the individual patient with cancer is often determined by the first doctor he consults, and this further emphasises the importance of sufficient education in oncology at all stages of medical training.
