Despite the prevalence of behavioral research conducted through genetic studies, there is an absence of literature pertaining to the genetics of motor behavior. Genetics and the Psychology of Motor Performance is the first book to integrate cutting-edge genetic research into the study of the psychological aspects of motor learning and control. The book's central line of enquiry revolves around the extent to which psychological factors central to motor proficiency – including personality, emotion, self-regulation, motivation, and perceptual-cognitive skills – are acquired or inherited. It explains how these factors affect motor performance, distilling the latest research into their genetic underpinnings and, in doing so, assessing the magnitude of the role genetics plays in the stages of motor development, from early proficiency through to expertise. Written by leading experts in the genetics of human performance and exercise psychology, and thoroughly illustrated throughout, Genetics and the Psychology of Motor Performance is a crucial resource for any upper-level student or researcher seeking a deeper understanding of motor learning. It is an important book for anyone studying or working in exercise psychology, motor development, exercise genetics, or exercise physiology more broadly.

This book provides a re-appraisal of Carl Jung's work as a personality theorist. Personality Theories: Critical Perspectives is the groundbreaking, final text written by Albert Ellis, long considered the founder of cognitive behavioral therapies. The book provides students with supporting and contradictory evidence for the development of personality theories through time. Without condemning the founding theorists who came before him, Ellis builds on more than a century of psychological research to re-examine the theories of Freud, Jung, and Adler while taking an equally critical look at modern, research-based theories, including his own.

This unique workbook was written for the undergraduate Personality course where professors are looking for activities to help students learn and apply personality theories to real-life examples. The workbook is geared toward personality courses that are theories-based, as opposed to research-based. Because the cases explored are those based on normal behavior (as opposed to abnormal behavior), this workbook is especially useful. While most personality texts present the major concepts of personality theories, they don't help students apply the theories they have learned or to use the theories to understand other examples on their own. This workbook will help students do just that and is the perfect complement to any Personality text.

The Science of Personality, 2/e is an undergraduate text that presents the field of personality as it exists today, rather than the grand theories of personality that have dominated personality texts since the 1960s. Major theories current in the field are discussed in relation to relevant research. Focusing on current research, each chapter begins with an overview followed by a list of questions devised to stimulate interest and to aid in relating research to broader issues. Boxed inserts feature a researcher whose work is covered in the chapter along with a personal statement regarding the development, contemporary significance and future direction of his or her work.

Differences between people are a fascinating and long-standing area of psychological inquiry. However, previous research has largely been confined to studies at the descriptive level. This book tries to explain individual difference, rather than merely describe them. Explanations are derived from two major competing frameworks: the biological and social approaches to individuality. The book is based on the contributions of specialists from Europe and North America invited to represent the biological and social points of view. Thus, a direct confrontation is obtained of two approaches that, hitherto, have proceeded with virtually no reference to each other. Attention is paid to behavior genetics, psychophysiology and temperament, as well as to social learning, behavioral strategies and person-environment interactions. Differences and commonalities between the biological and social approaches are scrutinized and a common framework is outlined to stimulate future research. Due to its innovative character, the book is particularly relevant for investigators in the field. In addition, it may be fruitfully used in advanced graduate level courses in personality psychology.
