Hormones provides a comprehensive treatment of human hormones viewed in the light of modern theories of hormone action and in the context of current understanding of subcellular and cellular architecture and classical organ

physiology. The book begins with discussions of the first principles of hormone action and the seven classes of steroid hormones and their chemistry, biosynthesis, and metabolism. These are followed by separate chapters that address either a classical endocrine system, e.g., hypothalamic hormones, posterior pituitary hormones, anterior pituitary hormones, thyroid hormones, pancreatic hormones, gastrointestinal hormones, calcium regulating hormones, adrenal corticoids, hormones of the adrenal medulla, androgens, estrogens and progestins, and pregnancy and lactation hormones; or newer domains of hormone action which are essential to a comprehensive understanding of hormone action, including prostaglandins, thymus hormones, and pineal hormones. The book concludes with a presentation of hormones of the future, i.e., cell growth factors. This book is intended for use by first-year medical students, graduate students, and advanced undergraduates in the biological sciences. It is also hoped that this book will fill the void that exists for resource materials for teaching cellular and molecular endocrinology and that it will be employed as an equal partner with most standard biochemistry textbooks to provide a comprehensive and balanced coverage of this realm of biology.

In this groundbreaking volume, David Schenck and Larry Churchill present the results of fifty interviews with practitioners identified by their peers as "healers," exploring in depth the things that the best clinicians do. They focus on specific actions that exceptional healers perform to improve their relationships with their patients and, subsequently, improve their patients' overall health. The authors analyze the ritual structure and spiritual meaning of these healing skills, as well as their scientific basis, and offer a new, more holistic interpretation of the "placebo effect." Recognizing that the best healers

are also people who know how to care for themselves, the authors describe activities that these clinicians have chosen to promote wellness, wholeness and healing in their own lives. The final chapter explores the deep connections between the mastery of healing skills and the mastery of what the authors call the "skills of ethics." They argue that ethics should be considered a healing art, alongside the art of medicine.
