The management of hazardous materials and industrial wastes is complex, requiring a high degree of knowledge over very broad technical and legal subject areas. Hazardous wastes and materials are diverse, with compositions and properties that not only vary significantly between industries, but within industries, and indeed within the complexity of single facilities. Proper management not only requires an understanding of the numerous and complex regulations governing hazardous materials and waste streams, but an understanding and knowledge of the treatment, post-treatment, and waste minimization technologies. In fact, today's environmental manager must face working

within twelve environmental management arenas, all of which may be applicable regardless of the size of the operation or business. This volume has been written as a desk reference for the Professional Hazards Manager (PHM). The PHM is a qualified environmental manager that has the responsibility of ensuring that his or her facility or division within the corporation is in compliance with environmental statutes and regulations, as well as participating in the selection of technologies and approaches to remediation, pollution control, and in implementing waste minimization practices. These decisions require knowledge and understanding of the federal, state, and local environmental regulations, a working knowledge of the best available technologies and their associated cost. This volume provides an overview of both the technology and compliance requirements that will assist environmental managers in addressing facility management of hazardous wastes, pollution control, and waste minimization. The book has been designed in part as a study guide to help prepare qualified individuals for the national certification

and registration program of Professional Hazards Managers conducted by the National Association of Safety & Health Professionals and other organizations including the Hazard Materials Control Resources Institute (HMCRI) and Fairleigh Dickinson University.

Although an integral part of the corporate world, the development and execution of a successful Environmental Safety and Health (ES&H) program in today's profit-driven business climate is challenging and complex. Add to that the scarcity of resources available to assist managers in successfully designing and implementing these programs and you've got a perfect storm of regulatory and contractual agreements imposed on businesses. *Guide to Environment Safety and Health Management: Developing, Implementing, and Maintaining a Continuous Improvement Program* guides you through the challenges of developing and maintaining an effective ES&H program for any organization. A strategic ES&H

program that follows project management concepts can add to the bottom line in many ways; however, the exact financial gain cannot oftentimes be quantified in the near term and in hard dollars. Written by two experts with more than 50 years of combined experience, this book covers the primary areas of ES&H and key elements that should be considered in developing, managing, and implementing an effective, compliant, and cost-effective program. Presenting information from a practical experience view, the book covers:

- Organizational structure and succession planning
- Fundamental understanding of EH&S functional areas
- Training Approach and measurement of continuous organizational improvement
- Project management of EH&S
- Application of technology
- Culture and trust in the workplace
- Regulatory applicability depends on the type of business, product produced, and potential impacts to employees, the public, and the environment.

Additionally, the perception exists with some business owners and executives that the "rules and regulations" imposed or enforced do not directly add to the bottom line. Giving you practical, from-

the-trenches knowledge, the book outlines techniques and provides guidance for addressing the challenges involved in setting up EH&S programs. It shows you how your ES&H program can ensure regulatory compliance and contribute to the success of your company both monetarily as well as in shaping public perception.

The participation in interlaboratory studies and the use of Certified Reference Materials (CRMs) are widely recognised tools for the verification of the accuracy of analytical measurements and they form an integral part of quality control systems used by many laboratories, e.g. in accreditation schemes. As a response to the need to improve the quality of

environmental analysis, the European Commission has been active in the past fifteen years, through BCR activity (now renamed Standards, Measurements and Testing Programme) in the organisation of series of interlaboratory studies involving expert laboratories in various analytical fields (inorganic, trace organic and speciation analysis applied to a wide variety of environmental matrices). The BCR and its successor have the task of helping European laboratories to improve the quality of measurements in analytical sectors which are vital for the European Union (biomedical, agriculture, food, environment and industry); these are most often carried out in support of EC regulations, industrial needs, trade, monitoring activities (including environment, agriculture, health and safety) and, more generally, when technical difficulties hamper a good comparability of data among EC laboratories. The collaborative projects carried out so far have placed the BCR in the position of second world CRM producer (after NIST in the USA). Interlaboratory Studies and Certification of Reference Materials for Environmental Analysis gives

an account of the importance of reference materials for the quality control of environmental analysis and describes in detail the procedures followed by BCR to prepare environmental reference materials, including aspects related to sampling, stabilization, homogenisation, homogeneity and stability testing, establishment of reference (or certified) values, and use of reference materials. Examples of environmental CRMs produced by BCR within the last 15 years are given, which represent more than 70 CRMs covering different types of materials (plants, biological materials, waters, sediments, soils and sludges, coals, ash and dust materials) certified for a range of chemical parameters (major and trace elements, chemical species, PAHs, PCBs, pesticides and dioxins). The final section of the book describes how to organise improvement schemes for the evaluation method and/or laboratory performance. Examples of interlaboratory studies (learning scheme, proficiency testing and intercomparison in support to prenormative research) are also given. **Developing, Implementing, and Maintaining a Continuous**
