Adaptive techniques play a key role in modern wireless communication systems. The concept of adaptation is emphasized in the *Adaptation in Wireless Communications Series* through a unified framework across all layers of the wireless protocol stack ranging from the physical layer to the application layer, and from cellular systems to next-generation wireless networks. This specific volume, *Adaptive Signal Processing in Wireless Communications* is

devoted to adaptation in the physical layer. It gives an in-depth survey of adaptive signal processing techniques used in current and future generations of wireless communication systems. Featuring the work of leading international experts, it covers adaptive channel modeling, identification and equalization, adaptive modulation and coding, adaptive multiple-input-multiple-output (MIMO) systems, and cooperative diversity. It also addresses other important aspects of adaptation in wireless communications such as hardware implementation, reconfigurable processing, and cognitive radio. A second volume in the series, *Adaptation and*

Cross-layer Design in Wireless Networks (cat no.46039) is devoted to adaptation in the data link, network, and application layers.

This collection surveys the tradition of medieval commentaries on Aristotle's "Nicomachean Ethics" from its thirteenth-century origins to the fifteenth century, concentrating on the conception of the moral and intellectual virtues in a continuous interplay of ancient and Christian moral thought.

According to its definition, synergetics is concerned with the cooperation of individual parts of a system that produces macroscopic temporal, spatial or functional structures. A good deal of the volumes published within this series dealt with the formation of truly macroscopic structures which we can see with our eyes. A common scheme could be developed to understand the formation of many patterns through self-organization. In particular, we have to use concepts which go beyond conventional thermodynamics. New ideas became crucial. We have to study kinetic processes, and often few highly excited degrees of

freedom play the decisive role in the evolution of structures. Over the past years it has turned out that quite similar lines of approach apply to a world which at first sight would be classified as "microscopic". That world consists of processes in which biomolecules are involved. An important example for the problems occurring there is provided by Manfred Eigen's theory of evolution of life at the molecular level (cf. his contribution to Volume 17 of this series). Another important example has been provided by Blumenfeld's book on problems of biological physics (Vol. 7 of this series). There it was proposed to treat biological molecules as machines which, in a

certain sense, work through "macroscopic" degrees of freedom.

This concise review of pathophysiology is designed to present disease as disordered physiology. Each chapter discusses normal structure and function, pathology and disordered physiology and mechanisms underlying symptoms and signs through the use of case studies.

The widespread use of adaptation techniques has helped to meet the

increased demand for new applications. From adaptive signal processing to cross layer design, *Adaptation in Wireless Communications* covers all aspects of adaptation in wireless communications in a two-volume set. Each volume provides a unified framework for understanding adaptation and relates various specializations through common terminologies. In addition to simplified state-of-the-art cross layer design approaches, they also describe advanced techniques, such as adaptive resource management, 4G communications, and energy and mobility aware MAC protocols. *CMR: Contracts for the International Carriage of Goods by Road*

World Scientific Now in its fourth edition, this hallmark text provides a comprehensive, article-by-article guide to the workings of the CMR Convention, as incorporated into English Law by the Carriage of Goods by Road Act 1965. This new edition is fully up to date with all major UK case law, plus major developments in the interpretation of the Convention in the case law of other Contracting States. Furthermore, the book includes expert guidance on the amendments introduced by the additional protocol concerning the electronic consignment note of 2008. The relationship between CMR and potentially conflicting legislation,

in particular the Judgments Regulation of 2001 and the Judgments Regulation (recast) of 2012, are also usefully examined. Praised as well-written and extremely accessible, Messent and Glass offer a level of expert detail and referencing that cannot be found elsewhere. This work is an invaluable reference tool that can be used by the busy legal practitioner, and by other road haulage industry professionals, in any contracting state, to solve the issues that confront them in daily practice. It is also an indispensable guide for academics and students of the international carriage of goods by road.

This proceedings brings together one hundred and fifty two selected papers presented at the 2015 International Conference on Mechanics and Mechatronics (ICMM 2015), which was held in Changsha, Hunan, China, during March 13-15 2015. ICMM 2015 focuses on 7 main areas — Applied Mechanics, Mechanical Engineering, Instrumentation, Automation, and Robotics, Computer Information Processing, and Civil Engineering. Experts in this field from eight countries, including China, South Korea, Taiwan, Japan, Malaysia, Hong Kong, Indonesia and Saudi Arabia, contributed to the collection of

research results and developments. ICMM 2015 provides an excellent international platform for researchers to share their knowledge and results in theory, methodology and applications of Applied Mechanics and Mechatronics. All papers selected to this proceedings were subject to a rigorous peer-review process by at least two independent peers. The papers are selected based on innovation, organization, and quality of presentation. BRILL

Written by a
combination of top
academics, industry
experts and leading
practitioners, this book
offers a detailed insight
into both unimodal and
multimodal carriage of
goods. It provides a
comprehensive and
thoroughly practical
guide to the issues that
matter today on what
is a very complex area
of law. From the
papers delivered at the
8th International
Colloquium organised
by Swansea Law
School's prestigious
Institute of
International Shipping
and Trade Law, this

original work considers current opinions, trends and issues arising from contracts of carriage of goods by sea, land, air, and multi-modal combinations of these, not to mention the legal position of vital participants such as freight forwarders, terminal operators and cargo insurers. The topics under discussion range through issues such as paperwork, piracy, liability for defective containers, damage in transit, the CMR Convention, and the possible effects of the Rotterdam Rules. An indispensable resource for transport lawyers, industry professionals, academics and post-graduate students of maritime law.
