Service Oriented Architecture (SOA) explained in Hindi Service Oriented Architecture Soa For Service Oriented Architecture ( SOA) is an architectural approach in which application components makes use of a collection of services available in a network, which communicates with each other. In service oriented architecture,

services communicate with each other, either to pass the data or to coordinating an activity. What Is SOA? Service Oriented Architecture [2020] Explained Service-oriented architecture (SOA) is a style of software design where services are provided to the other components by application components, through a communication protocol over a network. A SOA service is a discrete unit of functionality that can be accessed remotely and acted upon and updated independently, such as retrieving a credit card statement online. Service-oriented architecture - Wikipedia SOA, or service-oriented architecture, defines a

way to make software components reusable via service interfaces. These interfaces utilize common communication standards in such a way that they can be rapidly incorporated into new applications without having to perform deep integration each time.

**What is SOA (Service-Oriented Architecture)? | IBM**

In SOA, a service is a self-contained unit of software designed to complete a specific task. Service-oriented architecture allows various services to communicate using a loose coupling system to either pass data or coordinate an activity. Loose coupling refers to a client of a service remaining independent of the service it requires. In addition,

the client -- which can also be a service -- can communicate with other services, even when they are not related.

**What is SOA? Understanding Service-Oriented Architecture**

Service-Oriented Architecture (SOA) is an architectural style that supports service-orientation. Service-orientation is a way of thinking in terms of services and service-based development and the outcomes of services.
