How to Get a Specialty
Training Post CRC

It is a practical, illustrated guide to the Foundation Programme, introduced throughout the UK to regulate and standardise the two-year training of newly qualified doctors. It provides specific information on how to apply for a Foundation post, the curriculum, assessment methods, and maintaining a portfolio, as well as reviewing the pros and cons of the various medical specialities

which doctors can pursue after the Foundation years. The authors address issues of concern to all groups involved in the Foundation programme - trainees, trainers and senior doctors - and gives concrete examples of completed documentation and assessment. Helps UK and overseas doctors in choosing and applying for their Foundation Programme. Helps trainees and trainers understand the curriculum, the teaching and learning methods, and the use of the portfolio. Explains the various assessment procedures including the 'RITA' (Record of In-Training

Assessment) and gives examples. Helps trainees manage their learning and pass their assessments. Informs trainers - including consultants and GPs - about the purpose of the Foundation Programme and how to use the less-familiar assessment tools.

This book explores the identity work and conflicted perspectives of general practitioner (GP) trainees working in hospitals in the UK. Drawing on empirical and theoretical scholarship, and privileging the analysis of social language-in-use, Johnston describes primary care medicine as a separate paradigm with its own

philosophy, identity and practice. Casting primary and secondary care in historical conflict, the perceived lower status of primary care in the world of medicine is explored. Significant identity challenges ensue for GP trainees positioned at the coalface of conflict. Problematizing structures of GP training and highlighting how complex historical power dynamics play out in medical training, the author advocates for radical change in how GPs are trained in order to manage the current primary care recruitment and retention crisis.

A Practical Guide for Medical Teachers E-Book Oxford University Press

A common source of failure in a human-

dependent barrier or safety critical task is a designed-in mismatch error. The mismatch is a cognitive demand that exceeds the human capability to reliably and promptly respond to that demand given the plausible situations at that moment. Demand situations often include incomplete information, increased time pressures, and challenging environments. This book presents innovative solutions to reveal, prevent, and mitigate these and many other cognitive-type errors in barriers and safety critical tasks. The comprehensive model and methodologies also provide insight into where and to what extent these barriers and task types may be

significantly underspecified and the potential consequences. This title presents a new and comprehensive prototype design and lifecycle model specific to human-dependent barriers and safety critical tasks. Designed to supplement current practice, the model is fully underpinned by cognitive ergonomics and cognitive science. The book also presents a compelling case for why a new global consensus standard specific to human-dependent barriers is needed. Taking a novel approach, it presents its suggested basis, framing, and content. Both solutions seek to redress deficiencies in global regulations, standards, and practice. The model is guided by industry

recommendations and best practice guidance and solutions from globally recognized experts. Its processes are fully explained and supported by examples, analysis, and well-researched background materials. Real-life case studies from offshore oil and gas, chemical manufacturing, transmission pipelines, and product storage provide further insight into how overt and latent design errors contributed to barrier degradation and failure and the consequence of those errors. An essential and fascinating read for professionals, *Human Barrier Design and Lifecycle: A Cognitive Ergonomics Approach and Path Forward* will appeal to those in the fields of human factors,

process and technical safety, functional safety, display and safety system design, risk management, facility engineering, and facility operations and maintenance. Chapters 1 and 8 of this book are freely available as downloadable Open Access PDFs at <http://www.taylorfrancis.com> under a Creative Commons Attribution-Non Commercial-No Derivatives (CC-BY-NC-ND) 4.0 International license.

The NHS is more than a good idea. It is

beautiful. And it is you. The importance of the NHS – and the public’s affection for it – cannot be overstated, as seen through the COVID-19 pandemic. The author and his family of medics have lived and breathed the NHS, from before 1948, its birth and its history to date. But this book is for people who do not come from this medical background and do not have this life experience. Thus there are three target audiences. Firstly, it can contribute to A level study of the NHS, and career advice for 6th form students who are applying to university for a degree in healthcare. Secondly, it will educate health and social care professionals in training and in their

early years. So they can start with the knowledge that the author had when he went to university in 1979. Thirdly, the book is for everyone else, who want to know how it all fits together, and in this way, improve their healthcare, and that of their family.
