SUSAN KENNEDY

SAP HANA Advanced Modeling Independently Published
This book provides various insights on the overall HANA modeling process, which essentially involves the activities such as requirement analysis for the KPIs, solution design, creating information models (views), implementing SQL Script based solutions, performance optimization of the models, testing and validations. It will help the learners, in understanding the practical application of various SAP HANA modeling concepts to achieve complex reporting requirements. The contents of this book includes various building blocks of HANA modeling solutions: Key features and use cases of SAP HANA platform to

address various requirements related to analytics
Project planning approaches such as requirement analysis, implementation methodology and solution design aspects related to native HANA
Implementing Calculation views for different reporting requirements - Modeling Concepts and practical examples
SQL Script programming concepts and applications
Data validation and debugging techniques related to HANA models
Best practices for modeling HANA views, managing the changes and transports
Performance analysis tools and optimization methods for HANA models
Case studies and solution approaches using graphical modeling and SQL script
