Elias Raven's poetry has been gaining critical acclaim since he came onto the poetry scene a few years ago. His book "The Painted Shadows" has been recognized by many as a work that is both refreshing and challenging at the same time. His poetry is familiar, yet the style is fully his own. The authors meditations on love & loss, life & death, religion & spirituality, his own personal identity, humanity, history & sexuality all form a compelling narrative for the reader as he pushes the absolute limits of his creativity. This poet delves deeply into his past and present taking us all on a very real and personal journey of the spirit as he seeks to articulate his visions with the rest of us. "The poetry of his writing embodies a range of feelings and images that are always unpredictable, yet beautiful and haunting at the same time...His words resonate with the reader and open doorways to the limitless possibilities [whether he] is proposing his own re-interpretation or vision to historical images and text. His words are painful to read at times, the images that come forth bleed from his heart echoing in the interior of his soul, screaming his pain... Still other passages are deeply erotic and mesmerizing, leaving the reader to wonder how much is from this poets own personal reality. He can look into the night and transcend meaning, his words leave an indelible impression, causing the reader to dive back in again and again looking for hidden meanings and gems among the passages...Elias truly gives space to poetic meaning and initiates further dialogue leaving the reader wanting more and more." KB The assembled guest poets that are in the back of this book of poetry both old and new form a wonderful compliment to this gifted writers verse. Familiar names from the indie writing community like Ethan Radcliff, Alan Walker & Alexandria Sure along with a slew of new and upcoming poets all form a wonderful framework and introduction to this writers poetic vision.

Using our moral and technical imaginations to create responsible innovations: theory, method, and applications for value sensitive design. Implantable medical devices and human dignity. Private and secure access to information. Engineering projects that transform the Earth. Multigenerational information systems for international justice. How should designers, engineers, architects, policy makers, and others design such technology? Who should be involved and what values are implicated? In Value Sensitive Design, Batya Friedman and David Hendry describe how both moral and technical imagination can be brought to bear on the design of technology. With value sensitive design, under development for more than two decades, Friedman and Hendry bring together theory, methods, and applications for a design process that engages human values at every stage. After presenting the theoretical foundations of value sensitive design, which lead to a deep rethinking of technical design, Friedman and Hendry explain seventeen methods, including stakeholder analysis, value scenarios, and multilifespan timelines. Following this, experts from ten application domains report on value sensitive design practice. Finally, Friedman and Hendry explore such open questions as the need for deeper investigation of indirect stakeholders and further method development. This definitive account of the state of the art in value sensitive design is an essential resource for designers and researchers working in academia and industry, students in design and computer science, and anyone working at the intersection of technology and society.

This book is intended for classroom teaching in architectural and civil engineering at the graduate and undergraduate levels. Although it has been developed from lecture notes given in structural steel design, it can be useful to practicing engineers. Many of the examples presented in this book are drawn from the field of design of structures. Design of Steel Structures can be used for one or two semesters of three hours each on the undergraduate level. For a two-semester curriculum, Chapters 1 through 8 can be used during the first semester. Heavy emphasis should be placed on Chapters 1 through 5, giving the student a brief exposure to the consideration of wind and earthquakes in the design of buildings. With the new federal requirements vis a vis wind and earthquake hazards, it is beneficial to the student to have some understanding of the underlying concepts in this field. In addition to the class lectures, the instructor should require the student to submit a term project that includes the complete structural design of a multi-story building using standard design procedures as specified by AISC Specifications. Thus, the use of the AISC Steel Construction Manual is a must in teaching this course. In the second semester, Chapters 9 through 13 should be covered. At the undergraduate level, Chapters 11 through 13 should be used on a limited basis, leaving the student more time to concentrate on composite construction and built-up girders.

With the ever increasing number of samples to be assayed in agronomical laboratories and servicing stations, fertilizer and food industries, sugar factories, water treatment plants, biomedical laboratories, drug quality control, and environmental research, the interest for automated chemical analysis has been increasing. In this context, flow analysis is very attractive, as they the flow-based procedures are characterized by enhanced analytical figures of merit. Moreover, the flow analysers do not usually require sophisticated and expensive instrumentation, are amenable to full automation and to miniaturization, and are well suited for in situ analyses. The tendency to carry out traditional methods of analysis in the flow analyser has becoming more pronounced, especially in relation to large-scale routine analyses. The technology of solution handling has become more and more improved, leading to enhanced strategies for chemical assays. Consequently, different modalities of flow analysis (e.g. SFA, FIA, SIA) have been conceived, developed and applied to solve real problems. Most of the flow-based analytical procedures presently in use, however, do not exploit the full potential of flow analysis. The main object of the book is then to provide a scientific basis and to familiarise a wide community of researchers, students, technicians, etc with the uses of flow analysis. Emphasis is given to spectrophotometric and luminometric detection, in relation to agronomical, geological, industrial, pharmaceutical and environmental applications. The book includes historical and theoretical aspects, recent achievements in instrumentation, guidelines for methodology implementation, and applications. It serves also as an applications-oriented text book. Detailed historical and theoretical background Various modes of operation

The prevailing view among social scientists is that the psyche and the social reside in such disparate domains that their proper study demands markedly incompatible analytical and theoretical approaches. Over the last decade, scholars have begun to challenge this view. In this innovative work, George Cavalletto moves this challenge forward by connecting it to theoretical and analytical practices of the early 20th century. His analysis of key texts by Sigmund Freud, Max Weber, Theodor Adorno and Norbert Elias shows that they crossed the psycho-social divide in ways that can help contemporary scholars to re-establish an analytical and theoretical understanding of the inherent

interconnection of these two domains. This book will particularly interest scholars and students in sociology and social psychology, especially those in the fields of social theory, the sociology of emotion, self and society, and historical sociology.

In recent years there has been much debate surrounding the future of the welfare state in Europe, the complex factors influencing reform, and the extent to which responses to pressures on welfare could lead to irreversible systemic changes in social policy. By providing an in-depth analysis of social policy developments in Greece, this work furthers understanding of welfare reform trajectories in Europe. The authors thoroughly examine aspects of structural change, challenges and responses in major policy areas of employment, social security, family and gender, health and social care, and migration. Research issues central to the debate on 'recasting European welfare states', such as structural adjustments with regard to the production, organization and delivery of welfare, significant changes in the financial side of social protection, the role of political parties, the social partners and other major social actors in influencing (or resisting) policy reform, are at the forefront of the contributions to this volume. The scope and intensity of pressures on the Greek welfare state emanating from the supranational level and the challenges linked to European integration and economic and monetary union are also of crucial importance in the analyses undertaken.
