From boyhood in the coal-
mining village of Coello,
Illinois, to winning the
Priestly Medal and
becoming the president of
the American Chemical
Society, Professor
Emeritus Fred Basolo of
Northwestern University
traces the intertwined

development of his life,
career, and the field of
inorganic chemistry. With
over a hundred
photographs and dozens
of structures and
equations, From Coello to
Inorganic Chemistry
details the major
innovations, travels,
family life, and guests
hosted while helping to
build one of the world's
leading inorganic

chemistry departments from its humble beginnings at Northwestern University. Students and chemists with interests in bioinorganic chemistry, catalysis, nanoscience, new materials research, and organometallics can follow the emergence of inorganic chemistry as a rival to organic chemistry through the accomplishments of one of its most influential pioneers.

New Scientist magazine was launched in 1956 "for all those men and women who are interested in scientific discovery, and in its industrial, commercial and social consequences". The brand's mission is no different today - for its consumers, New Scientist reports, explores and interprets the results of human endeavour set in the context of society and culture.

A Lifetime of Reactions

John Wiley & Sons

'ESPE - The First 50 Years' tells the story of ESPE's

development from a small club of friends into an international scientific society. The European Society for Paediatric Endocrinology looks back on its history, major steps in the development of this new subspecialty, and how the 30 founders and the generations of scientists who followed them achieved a democratically structured professional organisation. Success in obtaining vital long-term sponsorship from the industry enabled the development of various high-level

educational programmes, fellowships, postgraduate schools, international research clusters and the establishment of prestigious scientific awards. In the second part of the book 21 senior ESPE members look back in personal recollections, and tell fascinating stories of their ESPE past. The third part provides a chronological overview with key data, including the most important scientific topics at ESPE's 50 annual meetings to date, eight of which were international Joint

Meetings. These reference overviews of meetings illustrate in detail the impressive development of paediatric endocrinology in Europe and around the world. *A Path Forward* CRC Press Colonized since the 1600s, Taiwan is largely a nation of settlers, yet within its population of twenty-three million are 500,000 Aboriginal people. In their quest to learn about disease and evolution, genetic researchers have eagerly studied this group over the past thirty years but

have often disregarded the rights of their subjects. Examining a troubling revival of racially configured genetic research and the questions of sovereignty it raises, *Living Dead in the Pacific* details a history of exploitation and resistance that represents a new area of conflict facing Aboriginal people both within Taiwan and around the world.

National Academies Press
For more than five decades, scientists and researchers have relied

on the *Advances in Chromatography* series for the most up-to-date information on a wide range of developments in chromatographic methods and applications. For Volume 55, established, well-known chemists offer cutting-edge reviews of chromatographic methods to pay tribute to the late Eli Grushka, beloved series editor, who inspired and mentored many in the field of separation science. The clear presentation of topics and vivid illustrations for which this series has

become known makes the material accessible and engaging to analytical, biochemical, organic, polymer, and pharmaceutical chemists at all levels of technical skill.

Scores of talented and

dedicated people serve the forensic science community, performing vitally important work. However, they are often constrained by lack of adequate resources, sound policies, and national support. It is clear that change and advancements, both systematic and scientific, are needed in a number of forensic science disciplines to ensure the reliability of work, establish enforceable standards, and promote best practices with consistent application.

Strengthening Forensic Science in the United States: A Path Forward provides a detailed plan for addressing these needs and suggests the creation of a new government entity, the National Institute of Forensic Science, to establish and enforce standards within the forensic science community. The benefits of improving and regulating the forensic science disciplines are clear: assisting law enforcement officials, enhancing homeland

security, and reducing the risk of wrongful conviction and exoneration. Strengthening Forensic Science in the United States gives a full account of what is needed to advance the forensic science disciplines, including upgrading of systems and organizational structures, better training, widespread adoption of uniform and enforceable best practices, and mandatory certification and accreditation programs. While this book provides an essential call-

to-action for congress and policy makers, it also serves as a vital tool for law enforcement agencies, criminal prosecutors and attorneys, and forensic science educators.

Pakistan Journal of Science John Wiley & Sons
Over the last half century, the science and practice of forensic science has undergone dramatic changes. Since the early 1960s the technological developments and their application to forensic science have been immense. Not only that,

the application of science within a legal context and framework has developed enormously, as has the evaluation of the analytical results obtained. This unique text looks at the changes and challenges within forensic science over the last fifty years through a continuous diary of development witnessed by the editorials and relevant correspondence delivered through the UK Forensic Science Societies' journal *Science and Justice* (formally the *Journal of the Forensic*

Science Society). The editorials are divided into sections relating to the developments of forensic practice, the advancement of science, education, legal aspects, forensic science and medicine, the international dimension of forensic science and the interpretation and evaluation of evidence. The text and first two sections are set in context by an introductory chapter written by Professor Brian Caddy examining the future of forensic science. • A key

text that traces the historical development of forensic science through reflective editorials published in the journal *Science and Justice*, and the *Journal of the Forensic Science Society* • Includes introductory chapter by Professor Brian Caddy • Divided into themed sections to reflect current

commentary and debate
