The panorama of bioethical problems is different today. Patients travel to Thailand for fast surgery; commercial surrogate mothers in India deliver babies to parents in rich countries; organs, body parts and tissues are trafficked from East to Western Europe; physicians and nurses migrating from Africa to the U.S; thousands of children or patients with malaria, tuberculosis and AIDS are dying each day because they cannot afford effective drugs that are too expensive. Mainstream bioethics as it has developed during the last 50 years in Western countries is evolving into a broader approach that is relevant for people across the world and is focused on new global problems. This book provides an introduction into the new field of global bioethics. Addressing these problems requires a broader vision of bioethics that not only goes beyond the current emphasis on individual autonomy, but that criticizes the social, economic and political context that is producing the problems at global level. This book argues that global bioethics is a necessity because the social, economic and environmental effects of globalization require critical responses. Global bioethics is not a finished product that can simply be applied to solve global problems, but it is the ongoing result of interaction and exchange between local practices and global discourse. It combines recognition of differences and respect for cultural diversity with convergence towards common perspectives and shared values. The book examines the nature of global problems as well as the type of responses that are needed, in order to exemplify the substance of global bioethics. It discusses the ethical frameworks that are available for global discourse and shows how these are transformed into global governance mechanisms and practices.

This book aims to clarify the potential association between frailty and cardiovascular disease in older people. Covering the biological as well as the clinical point of view, it allows researchers and clinicians to discover the significance of this topic. The contributions cover the most important aspects in the potential relationship between frailty and cardiovascular disease. In particular, authoritative authors in this field have clarified the definition and the epidemiology of frailty and cardiovascular disease in older people. A large part of the volume is dedicated to the biological mechanisms of frailty and cardiovascular disease, trying to find those in common between these two conditions. Since this book is dedicated to both researchers and clinicians, we have proposed some chapters to the importance of comprehensive geriatric assessment in the evaluation and treatment of cardiovascular diseases and frailty. In this regard, the importance of geriatric evaluation in cardiac surgery for older people is well covered. Finally, the importance of cardiac rehabilitation and physical exercise is summarized, being, actually, the most important treatments for both frailty and cardiovascular disease. Written by many well-known and widely published experts in their respective fields, this book will appeal to a wide readership such as researchers in the field and clinicians, especially suited in geriatric medicine and cardiology who, every day, face frail older patients.
