Cephalopod Behaviour CRC Press
This is a lab manual for a college-level human anatomy course. Mastery of anatomy requires a fair amount of memorization and recall skills. The activities in this manual encourage students to engage with new vocabulary in many ways, including grouping key terms, matching terms to structures, recalling definitions, and written exercises. Most of the activities in this manual utilize anatomical models, and several dissections of animal tissues and histological examinations are also included. Each unit includes both pre- and post-lab questions and six lab exercises designed for a classroom where students move from station to station. The vocabulary terms used in each unit are listed at the end of the manual and serve as a checklist for practicals.

Basic Physiology is an introduction to vertebrate physiology, stressing human physiology at the organ level, and includ ing requisite anatomy integrated with function. One chapter deals solely with topographic anatomy in atlas form and microscopic anatomy of the principal tissues of the body. Additional chapters cover cellular and general physiology; nervous system, muscle; blood and tissue fluids, heart and circulation; respiration, digestion and absorption; intermedi ary metabolism; energy metabolism; temperature regulation; nutrition; kidney; endocrinology, including hypophysis, re production; thyroids, parathyroids, adrenals and pancreas. All concepts are emphasized and well illustrated, and con troversial material is omitted. It is written at a level suited to undergraduate students who have had introductory courses in biology, chemistry, and mathematics, and to more ad vanced students who wish to review the basic concepts of physiology. This volume should be especially useful as a text for de partments of biology, zoology, nursing, health, and agricul tural sciences that offer courses in vertebrate and human physiology. Basic Physiology is written by seven subject matter special ists who have considerable experience in teaching their specialty to undergraduates studying physiology and biology.

Unlike other human senses, the exact mechanisms that lead to our perception of flavor have not yet been elucidated. It is recognised that the process involves a wide range of stimuli, which are thought likely to interact in a complex way, but, since the chemical compounds and physical

structures that activate the flavor sensors change as the food is eaten, measurements of the changes in stimuli with time are essential to an understanding of the relationship between stimuli and perception. It is clear that we need to consider the whole process - the release of flavor chemicals in the mouth, the transport processes to the receptors, the specificity and characteristics of the receptors, the transduction mechanisms and the subsequent processing of signals locally and at higher centres in the brain. This book provides a state-of-the-art review of our current understanding of the key stages of flavor perception for those working in the flavor field, whether in the academic or industrial sector. In particular, it is directed at food scientists and technologists, ingredients suppliers and sensory scientists.

Many advances have been made in the last decade in the understanding of the computational principles underlying olfactory system functioning. Neuromorphic Olfaction is a collaboration among European researchers who, through NEUROCHEM (Fp7-Grant Agreement Number 216916)—a challenging and innovative European-funded project—introduce novel computing paradigms and biomimetic artifacts for chemical sensing. The implications of these findings are relevant to a wide audience, including researchers in artifical olfaction, neuroscientists, physiologists, and scientists working with chemical sensors. Developing neuromorphic olfaction from conceptual points of view to practical applications, this cross-disciplinary book examines: The biological components of vertebrate and invertebrate chemical sensing systems The early coding pathways in the biological olfactory system, showing how nonspecific receptor populations may have significant advantages in encoding odor intensity as well as odor identity The redundancy and the massive convergence of the olfactory receptor neurons to the olfactory bulb A neuromorphic approach to artificial olfaction in robots Reactive and cognitive search strategies for olfactory robots The implementation of a computational model of the mammalian olfactory system The book’s primary focus is on translating aspects of olfaction into computationally practical algorithms. These algorithms can help us understand the underlying behavior of the chemical senses in biological systems. They can also be translated into practical applications, such as robotic navigation and systems for uniquely detecting chemical species in a complex background.

The Biology of the Monotremes is an attempt to make available all gathered information about monotremes to the greater public. This book specifically targets the students, newly graduates, teachers, and researchers interested in the study of life processes and evolution. This book comprises of 10 chapters. Each chapter except Chapter 10 discusses three genera - Ornithorhynchus, Tachyglossus, and Zaglossus. Chapter 1 serves as an introduction to the subject matter. It covers the discovery and general anatomy of the monotremes. In accordance, Chapter 2 discusses the different kinds of monotremes and its other aspects. Aside from the mentioned genera, it also includes Obdurodon insignis. In Chapter 3, the food and feeding habits of the monotremes is given focus. Meanwhile, the varied physiology of monotremes is the subject of Chapter 4, and temperature regulation in Chapter 5. A more detailed and thorough discussion regarding the anatomy of the monotremes is provided in Chapters 6 through 9. The discussion covers topics including the glands in the endocrine and immune systems, as well as special senses, organs, and behavior of monotremes. Its reproduction and embryology is also discussed. This book explains as well the mammal’s lactation, composition of the milk, sucking, and growth of the young. Lastly, Chapter 10 provides the readers with four differing views regarding the relationship of the monotremes with the rest of the mammals.
