An Introduction To Parallel Programming  
 An Introduction to Parallel Programming, Second Edition presents a tried-and-true tutorial approach that shows students how to develop effective parallel programs with MPI, Pthreads and OpenMP. An Introduction to Parallel Programming: Peter Pacheco ...  
 An Introduction to Parallel Programming is the first undergraduate text to directly address compiling and running parallel programs on the new multi-core and cluster architecture. It explains how to design, debug, and evaluate the performance of distributed and shared-memory programs. An Introduction to Parallel Programming - 1st Edition  
 An Introduction to Parallel Programming is an elementary introduction to programming parallel systems with MPI, Pthreads, and OpenMP. It is intended for use by students and professionals with some knowledge of programming conventional, single-processor systems, but who have little or no experience programming multiprocessor systems. An Introduction to Parallel Programming  
 The first undergraduate text to directly address compiling and running parallel programs on the new multi-core and cluster architecture, An Introduction to Parallel Programming explains how to design, debug, and evaluate the performance of distributed and shared-memory programs. User-friendly exercises teach students how to compile, run and modify example programs. An Introduction to Parallel

 Why Do Parallel Programming?  
 • Limits of single CPU computing - performance - available memory  
 • Parallel computing allows one to:  
 - solve problems that don't fit on a single CPU  
 - solve problems that can't be solved in a reasonable time  
 • We can solve...  
 - larger problems - faster - more cases

 Introduction to Parallel Programming - cac.cornell.edu  
 The primary intent of parallel programming is to decrease execution wall clock time, however in order to accomplish this, more CPU time is

required. For example, a parallel code that runs in 1 hour on 8 processors actually uses 8 hours of CPU time.  
 Introduction to Parallel Computing  
 Depending on the application, two common approaches in parallel programming are either to run code via threads or multiple processes, respectively. If we submit "jobs" to different threads, those jobs can be pictured as "sub-tasks" of a single process and those threads will usually have access to the same memory areas (i.e., shared memory).
