This handbook serves as a guide to deploying battery energy storage technologies, specifically for distributed energy resources and flexibility resources. Battery energy storage technology is the most promising, rapidly developed technology as it provides higher efficiency and ease of control. With energy transition through decarbonization and decentralization, energy storage plays a significant role to enhance grid efficiency by alleviating volatility from demand and supply. Energy storage also contributes to the grid integration of renewable energy and promotion of microgrid.

This book reflects and expands on the current trends in the Architecture Engineering and Construction (AEC) industries to respond to the unfolding climate and biodiversity crisis. Shifting away from the traditional focus, narrowly centered on efficiency, the book presents a variety of approaches to move the AEC community from an approach that presents new challenges in all areas of the industry, from a linear, extractive paradigm to circular and regenerative one. The book presents contributions including research papers and case studies, providing a comprehensive overview of the field as well as perspectives from related disciplines, such as computer science, biology and material science. The chapter authors were invited speakers at the 8th Design Modelling Symposium "Towards Radical Regeneration", which took place at the University of the Arts in Berlin in September 2022.

Rapid development observed in modern production is firmly connected with the development of new assembly and disassembly systems. In small batch production, where fast changes of products and short development times of new products are demanded, development of reliable, fast-adaptable and self-teaching assembly systems can be observed. Important fields of product development such as product design, development of planning systems, simulation and modelling, logistics, mechatronics and sensors, development of new assembly system components as well as collecting and processing of knowledge are essential for the development of new intelligent assembly systems (IAS). The aim of this colloquium specialised on IAD is to highlight this topic, show the actual results of the research and development work, set the direction of future development and analyse the possibilities of introducing of IAD into the production process. Papers, presented at the workshop, showed that the disassembly process and disassembly systems are becoming more and more important in the product life cycle and in the national economy. Some topical issues in disassembly, for example the environment legislation, the product as well as part recycling properties, disassembly tools and system development were discussed.
