with a new classification problem, machine learning practitioners have a dizzying array of algorithms from which to choose: Naive Bayes, decision trees, Random Forests, Support Vector Machines, and many others. Guide to an in-depth understanding of logistic regression Let's get their basic idea: 1. Multinomial Logistic Regression: Let's say our target variable has $K = 4$ classes. This technique handles the multi-class problem by fitting $K-1$ independent... 2. Ordinal Logistic Regression: This technique is used when the target variable is ordinal in nature. Let's ...
