This volume contains the presentations of the Fifth Symposium on Theoretical Aspects of Computer Science (STACS 88) held at the University of Bordeaux, February 11-13, 1988. In addition to papers presented in the regular program the volume contains abstracts of software systems demonstrations which were included in this conference series in order

to show applications of research results in theoretical computer science. The papers are grouped into the following thematic sections: algorithms, complexity, formal languages, rewriting systems and abstract data types, graph grammars, distributed algorithms, geometrical algorithms, trace languages, semantics of parallelism.

Recent Developments in Nonlinear Partial Differential Equations Edinburgh University Press

The Handbook of Nonlinear Partial Differential Equations is the latest in a series of acclaimed handbooks by these authors and presents exact solutions of more than 1600 nonlinear equations encountered in science and engineering--many more than any other book available. The equations include those of parabolic, hyperbolic, elliptic and other types, and the authors pay special attention to equations of general form that involve arbitrary functions. A supplement at the end of the book discusses the classical and new methods for constructing exact

solutions to nonlinear equations. To accommodate different mathematical backgrounds, the authors avoid wherever possible the use of special terminology, outline some of the methods in a schematic, simplified manner, and arrange the equations in increasing order of complexity. Highlights of the Handbook:

*Nonlinear Acoustic Waves in Micro-inhomogeneous Solids* covers the broad and dynamic branch of nonlinear acoustics, presenting a wide variety of different phenomena from both experimental and theoretical perspectives. The introductory chapters, written in the style of graduate-level textbook, present a review of the main achievements of classic nonlinear acoustics of homogeneous media. This enables readers to gain insight into nonlinear wave processes in homogeneous and micro-inhomogeneous solids and compare it within the framework of the book. The subsequent eight chapters covering: Physical models

and mechanisms of the structure nonlinearity of micro-inhomogeneous media with cracks and cavities; Elastic waves in media with strong acoustic nonlinearity; Wave processes in micro-inhomogeneous media with hysteretic nonlinearity; Wave processes in nonlinear micro-inhomogeneous media with relaxation; Wave processes in the polycrystalline solids with dissipative and elastic nonlinearity caused by dislocations; Experimental studies of the nonlinear acoustic phenomena in polycrystalline rocks and metals; Experimental studies of nonlinear acoustic phenomena in granular media; and Nonlinear phenomena in seismic waves are dedicated to the theoretical and experimental research of nonlinear processes, caused by longitudinal elastic waves propagation and interaction in the micro-inhomogeneous media with a strong acoustical nonlinearity of different types (elastic, hysteretic, bimodular, elastic quadratic and non-elastic). This valuable monograph is intended for graduate students and researchers in applied physics, mechanical engineering, and applied mathematics, as well as those working in a wide spectrum

of disciplines in materials science.

Algorithmic number theory is a rapidly developing branch of number theory, which, in addition to its mathematical importance, has substantial applications in computer science and cryptography. Among the algorithms used in cryptography, the following are especially important: algorithms for primality testing; factorization algorithms for integers and for polynomials in one variable; applications of the theory of elliptic curves; algorithms for computation of discrete logarithms; algorithms for solving linear equations over finite fields; and, algorithms for performing arithmetic operations on large integers. The book describes the current state of these and some other algorithms. It also contains extensive bibliography. For this English translation, additional references were prepared and commented on by the author.

Os prelúdios e sinfonias de Carlos Gomes contrastam com os rótulos associados a ele ao longo do tempo: ora um compositor romântico e um melodista "inspirado", ora um compositor conservador e datado que realizou "transplantações para o nosso mundo dinâmico de melodias mofinas e lânguidas, marcadas pelo metro de outras gentes", como o definiu, numa velada referência, o modernista Graça Aranha durante a conferência inaugural da Semana de 22. Essas críticas realizadas pelos modernistas desencorajam durante

muito tempo uma avaliação mais profundo da obra de Gomes. Neste livro, Marcos Pupo Nogueira analisa a extensão e a diversidade dos diálogos do compositor paulista com as estéticas musicais dos anos 1970, 1980 e início dos 1990 do século XIX e demonstra como as ideias de Gomes para o gênero orquestral contribuíram para o processo de transformações pelas quais têm passado essas formas sinfônicas desde seu surgimento no século XVII.

This book constitutes the refereed proceedings of the 8th Asian Computing Science Conference, ASIAN 2003, held in Mumbai, India in December 2003. The 16 revised full papers presented together with 2 invited papers were carefully reviewed and selected from 53 submissions. Among the topics addressed are type theory for operating systems protection, self configurable servers,

network services, predicate detection, hierarchical specification, proof theory, electronic auctions, secure mobile computing, programming cascades, access control, middleware, program logic, real-time systems, and probabilistic distributed systems.

PC Mag African Studies Association Three-dimensional cutaway illustrations and floor plans of key landmarks complement these richly illustrated, fully updated travel handbooks that also include enhanced maps, street-by-street guides, background information on a host of popular sights, and an expanded traveler's survival guide providing tips on hotels, restaurants, local customs, transportation, medical services, museums, entertainment, and more.

This volume contains research and expository articles based on talks presented at the 2nd Symposium on Analysis and PDEs, held at Purdue University. The Symposium focused on topics related to the theory and applications of nonlinear partial differential equations that are at the forefront of

current international research. Papers in this volume provide a comprehensive account of many of the recent developments in the field. The topics featured in this volume include: kinetic formulations of nonlinear PDEs; recent unique continuation results and their applications; concentrations and constrained Hamilton-Jacobi equations; nonlinear Schrodinger equations; quasiminimal sets for Hausdorff measures; Schrodinger flows into Kahler manifolds; and parabolic obstacle problems with applications to finance. The clear and concise presentation in many articles makes this volume suitable for both researchers and graduate students.
