LEED v4 Practices, Certification, and Accreditation Handbook John Wiley & Sons
According to the CSI, a CDT candidate must demonstrate

knowledge in these areas: “ The construction process ” Construction contract types Modifications and substitution procedures “ Contractual relationships ” Rights, duties, and responsibilities Contract provisions Relationship and organization of construction documents “ Use of construction documents ” Organizational formats Interpreting construction documents The CDT designation is a prerequisite to other advanced level CSI certification exams. Most knowledge covered are based on industry's best practices and the AIA requirements/conditions. A Certified Construction Product Representative CCPR, on the other hand, is an individual who has completed both the Construction Documents Technology CDT exam and the CCPR exam, and has demonstrated the minimum knowledge and ability to prepare a contract for construction the CSI way. Successful candidates should be able to demonstrate their knowledge and understanding of the various types of construction contracts. Knowledge in the design, procurement, construction, and facility management phases of a project is covered. In fact both exams share a lot of common knowledge areas and we recommend that you study both together. Even though the role of CCPR assumes that you are working for the supplier, the underlying knowledge is the same. The CCPR exam does have more coverage on sales and marketing as well as facility management.

Excellent bridge between general solid-state physics textbook and research articles packed with providing detailed explanations of the electronic, vibrational, transport, and optical properties of semiconductors "The most striking feature of the book is its modern outlook ... provides a wonderful foundation. The most wonderful feature is its efficient style of exposition ... an excellent

book." Physics Today "Presents the theoretical derivations carefully and in detail and gives thorough discussions of the experimental results it presents. This makes it an excellent textbook both for learners and for more experienced researchers wishing to check facts. I have enjoyed reading it and strongly recommend it as a text for anyone working with semiconductors ... I know of no better text ... I am sure most semiconductor physicists will find this book useful and I recommend it to them." Contemporary Physics Offers much new material: an extensive appendix about the important and by now well-established, deep center known as the DX center, additional problems and the solutions to over fifty of the problems at the end of the various chapters.

Building Construction Illustrated

An authorised reissue of the long out of print classic textbook, *Advanced Calculus* by the late Dr Lynn Loomis and Dr Shlomo Sternberg both of Harvard University has been a revered but hard to find textbook for the advanced calculus course for

decades. This book is based on an honors course in advanced calculus that the authors gave in the 1960's. The foundational material, presented in the unstarred sections of Chapters 1 through 11, was normally covered, but different applications of this basic material were stressed from year to year, and the book therefore contains more material than was covered in any one year. It can accordingly be used (with omissions) as a text for a year's course in advanced calculus, or as a text for a three-semester introduction to analysis. The prerequisites are a good grounding in the calculus of one variable from a mathematically rigorous point of view, together with some acquaintance with linear algebra. The reader should be familiar with limit and continuity type arguments and have a certain amount of mathematical sophistication. As possible introductory texts, we mention *Differential and Integral Calculus* by R Courant, *Calculus* by T Apostol, *Calculus* by M Spivak, and *Pure Mathematics* by G Hardy. The reader should also have some experience with partial derivatives. In overall plan the book divides roughly into a first half which develops the calculus (principally the differential calculus) in the setting of normed vector spaces, and a second half which deals with the calculus of differentiable manifolds.
