Questions & Answers

Elsevier Health Sciences Adolescent endometriosis is a previously overlooked disease in children, the

true prevalence of which is still unknown but has been estimated between 19-73%. There are numerous initial challenges faced by adolescents suffering from delayed or undiagnosed endometriosis apart from experiencing chronic pain, such as: school/work absenteeism, false diagnoses/treatments, erroneous physician referrals, unnecessary radiological studies, radiation exposure, and emergency room visits as well as early exposure to narcotic pain medications and subsequent drug tolerance, resistance or even addiction. This text presents a clear history of physician and patient understanding and awareness of endometriosis in adolescents. It lays the groundwork for this condition with background information on endometriosis in general followed by a more focused look at endometriosis in adolescents. Leading experts in the field provide chapters on the different locations where endometriotic lesions can present in adolescents as well as identified risk factors and concomitant diseases of which it is

important to be aware. In addition to the clinical presentation, this book also provides information on breaking down existing barriers, such as stigma, and current activism and awareness of this condition. Adolescent Endometriosis is a first-of-its-kind text that focuses exclusively on endometriosis in the adolescent population. Written by experts in the field, this book is a comprehensive resource for clinicians in all medical disciplines that treat adolescent age girls. *Ambulatory Gynecology* Springer Nature Abnormal uterine bleeding (AUB) is a common presenting symptom for both gynecologists and family practitioners with complex etiology and challenging differential diagnosis. Many cases of AUB can be managed effectively with hormonal, anti-inflammatory or antifibrinolytic agents. Although surgical management may include hysterectomy, more often one of a variety of less invasive, uterus-sparing procedures provides an effective and satisfactory clinical outcome. Effective management of women with AUB is enhanced by an understanding of the

relevant basic sciences and the various mechanisms by which symptoms evolve. This includes clinical evaluation, the application of appropriate laboratory and imaging techniques and the identification of a customized menu of potential therapeutic interventions. Written by a leading practitioner, the approach includes advice on history taking, clinical examination and appropriate therapy. Basic science aspects are limited to what is really relevant to the clinicians. The accompanying DVD includes videos, animations, color images and patient support material to facilitate learning. A spectrum of providers and trainees will find this book to be an invaluable resource, including those from primary care, gynecology and family planning.

This book provides teaching scripts for medical educators in internal medicine and coaches them in creating their own teaching scripts. Every year, thousands of attending internists are asked to train the next generation of physicians to master a growing body of knowledge. Formal teaching time has become increasingly limited due to rising clinical workload, medical documentation requirements, duty hour restrictions, and other time pressures. In addition, today's physicians-in-training expect teaching sessions that deliver focused, evidence-based content that is integrated into clinical workflow. In keeping with both time pressures and trainee expectations, academic internists must be prepared to effectively and efficiently teach important diagnostic and management concepts. A teaching script is a methodical and structured plan that aids in effective teaching. The teaching scripts in this book anticipate learners' misconceptions, highlight

a limited number of teaching points, provide evidence to support the teaching points, use strategies to engage the learners, and provide a cognitive scaffold for teaching the topic that the teacher can refine over time. All divisions of internal medicine (e.g. cardiology, rheumatology, and gastroenterology) are covered and a section on undifferentiated symptom-based presentations (e.g. fatigue, fever, and unintentional weight loss) is included. This book provides well-constructed teaching scripts for commonly encountered clinical scenarios, is authored by experienced academic internists and allows the reader to either implement them directly or modify them for their own use. Each teaching script is designed to be taught in 10-15 minutes, but can be easily adjusted by the reader for longer or shorter talks. Teaching Scripts in Internal Medicine is an ideal tool for internal medicine attending physicians and trainees, as well as physician's assistants, nurse practitioners, and all others who teach and learn internal medicine. This book aims to provide condensed and crystallised knowledge, providing the rationale for investigations and interventions. Emergency medicine is a specialty where time and knowledge are critical factors in deciding appropriate management which could otherwise result in loss of life or limb. The challenge often is to have lucid management plans, whilst standing at the bedside of the patient. In order to address this challenge, a manuscript is needed which aims to enhance the clinical skills of the emergency physician. The objective of this book is to compile a road map for practitioners of emergency medicine, which would guide them through algorithm-based pathways. This format is distinctive by nature for its concise presentation, which facilitates easy reading and early application. Written by global experts, this book aims to be a truly international representation of emergency physicians who have come together to deliver contemporary concepts in emergency patient care. Abnormal uterine bleeding (AUB) is among the most common gynecologic complaints of reproductive-age women in ambulatory care settings. It is estimated to affect 11 to 13% of reproductive-age women at any given time. Prevalence increases with age, reaching 24% in women aged 36 to 40. Women generally present for care because the amount, timing, or other characteristics of the bleeding have changed from their individual norm. Population norms for menstrual bleeding, as established by 5th and 95th percentiles, are: Frequency of menses within a 24- to 38-day window; Regularity (i.e., cycle-to-cycle variation) within 2 to 20 days; Duration of flow from 4 to 8 days; Blood loss volume from 5 to 80 ml. Symptoms outside this normal range, or different from normal for the individual, can become problematic and deserve evaluation because they can warn of underlying conditions. Common problems include worry about the cause, embarrassment if the bleeding includes flooding-type bleeding with saturation of clothing, missed work and

responsibilities, limitations of social activities and exercise, decreases or changes in sexual activity, and frustration with costs of sanitary protection. Collectively, the effects of troublesome bleeding reduce quality of life and drive desire for information about causes and treatment options. There is not a clear consensus on the clinical evaluation of a patient presenting with abnormal bleeding. Recommendations suggest that initial evaluation confirm the source and timing of bleeding, and exclude certain architectural etiologies (e.g., fibroids, polyps), cancer and precancerous changes in the cervix or uterus, coagulation defects, and systemic disease. The 2011 International Federation of Gynecology and Obstetrics (FIGO) classification recommends a structured history followed by uterine evaluation. In the research setting, the alkaline hematin method is the preferred technique for direct measurement of total menstrual blood loss (MBL). The pictorial blood loss assessment chart is a semi-quantitative tool for uniform reporting of

bleeding as represented by the degree of saturation of sanitary pads and tampons. Diagnostic tools and evaluation strategies are not within the scope of this review; however, the review captures the operational definitions used by researchers and addresses applicability of the findings to contemporary practice. The literature reflects various management options for women with AUB with conflicting recommendations/summaries. Interventions of interest for this review include medical, complementary and alternative medicine, and behavioral/lifestyle interventions. This review is focused on the evidence available to inform selection of nonsurgical options to treat AUB with an emphasis on interventions that are accessible to and within the scope of usual practice for primary care practitioners in a clinical care setting. Key Questions addressed include: KQ 1A: What is the evidence for the effectiveness of medical, behavioral, and complementary and alternative medicine interventions (e.g., hormonal treatment,

weight loss, or acupuncture) for improving short and long-term outcomes in women with irregular uterine bleeding? KQ 1B: What is the evidence for the effectiveness of medical, behavioral, and complementary and alternative medicine interventions (e.g., hormonal treatment, weight loss, or acupuncture) for improving short and long-term outcomes in women with abnormal cyclic uterine bleeding? KQ 2: What are the harms, including adverse events, associated with medical, behavioral, and complementary and alternative medicine interventions (e.g., hormonal treatment, weight loss, or acupuncture) in women with irregular uterine bleeding or abnormal cyclic uterine bleeding? Management of Endometrial Cancer Springer Nature The most common times that women experience heavy or prolonged menstrual periods are during the first few years of menstruation at adolescence and during the final two to three years of menstruation just before menopause. Abnormal uterine

bleeding is any type of bleeding from the vagina that is not normal. This may mean bleeding at times of the month other than the regular period, or that the period is unusually heavy. The need to change a pad or tampon more than once every 1-2 hours indicates that the period is unusually heavy. If the period lasts more than 7 days or fewer than 2 days, this is also abnormal uterine bleeding. Although abnormal uterine bleeding is most common in the pubertal and perimenopausal period, vaginal bleeding in girls before the onset of the menses is abnormal. In postmenopausal women, vaginal bleeding that persists for 12 months after the cessation of the menses is abnormal.

Women and abnormal uterine bleeding: some facts and statistics: (i) Menstrual disorders were the reason for 19.1% of 20.1 million visits to physician offices for gynecologic conditions over a 2-year period. (ii) A reported 25% of gynecologic surgeries are done for abnormal uterine bleeding. (iii) In girls who experience abnormal uterine bleeding before the onset of menstruation, many cases involve

lesions of the reproductive system, and some of these lesions may be malignant. In these cases, a thorough evaluation must be done. (iv) Menstrual irregularities are associated with thyroid disease. Through this book, we have tried to provide an 'easy-to-understand' overview of the current and important aspects of abnormal uterine bleeding, one of the most common complaints facing gynecologists and among the leading reasons for hysterectomy. Besides providing an insight into the varied causes of abnormal uterine bleeding and its conventional management, we have also focused on the rapidly evolving field of conservative and noninvasive modalities for the management of abnormal and heavy vaginal bleeding. This book can act as a ready reference in the consulting room for all practicing gynecologists and will also prove helpful to postgraduate and undergraduate medical students.

There are approximately 55,000 practicing ob/gyns in the United States. The obstetrics and gynecology residency training authority (the Accreditation Council for Graduate Medical Education) has now pushed ambulatory primary and preventative care to the top of its list for residency training. Interest in the area of ambulatory gynecology is not just growing in the field of ob/gyn, however; family and primary care practitioners, emergency room physicians, and advance practice nurses

all must know how to diagnose, manage, and treat gynecological conditions. Since office technology has expanded and decision-making has become increasingly complex, physicians need a guide through the endless list of treatment options for commonly presenting gynecologic disorders. Ambulatory Gynecology gives practitioners tools for diagnosis, investigation and management of these disorders, including decision-making algorithms. The text is evidence-based. From endocrine disorders to breast disease, preventative measures for osteoporosis to management of an abnormal pap smear, from adolescent gynecology to menopause, this book is crucial for office-based physicians to feel confident practicing in all areas of gynecology.
