Data Transmission at Millimeter Waves - Exploiting the 60 ...
The millimeter wave spectrum operates above the 24 GHz band, and, as you'd expect, it's great for superfast data transmission.

But, as we mentioned earlier, the millimeter wave spectrum is prone to distortion. Think of the millimeter wave spectrum like a laser beam: it's precise and dense, but it's only capable of covering a small area.

This book describes the design of a receiver front-end circuit for operation in the 60GHz range in 90nm CMOS. Physical layout of the test circuit and post-layout simulations for the implementation of a test chip including the QVCO and the first stage divider are also presented.

Millimeter waves can support higher data rate due to higher bandwidth. Conventional higher data rate

transmission required fiber optic cable installation. It has difficulties for implementation, maintenance and it is not economical.

Extremely high frequency (EHF) is the International Telecommunication Union (ITU) designation for the band of radio frequencies in the electromagnetic spectrum from 30 to 300 gigahertz (GHz). It lies between the super high frequency
