This book presents several complex case studies related to water management and planning in the context of pollution, growing demands, and global climate change in Mexico, but which are also relevant for other countries in Latin America. These concerns are of critical importance for policymakers who are coping with multiple conflicting interests. Water availability in Mexico is polarized, with abundant rainfall and large rivers in the south, and desert-like conditions in the north. The central region, which is the most industrialized, is overpopulated. Mexico City pours millions of cubic meters of "blackwater" into the northern valley daily and receives its clean water from the south. To address these unsustainable conditions, the world's 4th biggest water treatment plant went into operation in 2018. The water infrastructure and governance must satisfy the demands of all sectors, including agricultural, urban, and economic activities. At the same time, water resources are affected by drought, and climate change puts constraints on the supply. As such, regulation and monitoring are important when it comes to adherence to agreed plans and priorities. The book is divided into four sections. 1: Water Availability discusses quantitative aspects, such as supply, methods of calculation, and fracking. 2: Water Quality highlights pollution risks and diagnosis of water resources. 3: Water Allocation examines the sectoral demands and vulnerability due to unsustainable irrigation. 4: Water Governance and Management focuses on laws, urban rules, national parks, planning, and integrated water resources management, among other topics. The chapters include illustrative case studies in Mexico, such as basins, cities, reservoirs, and aquifers, water supply demand assessment, planning, and management.

Análisis económico aplicado a la industria del petróleo, en sus fases de exploración, producción, refinación, transporte y mercadeo. Historia de la industria venezolana. A su tercer siglo continuo de uso global, los hidrocarburos siguen siendo hoy día la fuente energética más importante. Por tal motivo, y dada la complejidad de las evaluaciones requeridas para acometer proyectos de esa naturaleza, proponemos un enfoque integral para su mejor comprensión, desarrollando una teoría general de orientación empírica que hemos denominado "Metodología Envolvente," que considera la interacción simultánea de tres conceptos fundamentales. En primer lugar, identificamos una instancia que denominamos "fuente de poder," en la cual se detectan las necesidades de ejecución de proyectos, se evalúan apropiadamente y se proveen de los recursos necesarios, tanto humanos como de orden financiero, logístico, equipamiento, herramientas, materiales y hasta del tipo de

energía requerida. En una segunda sala, analizaremos las "condiciones de entorno," que circundan, determinan y permiten la realización de proyectos en la industria de los hidrocarburos, tales como los factores geopolíticos y de mercado, los aspectos legislativos, impositivos, organizacionales y otros. El tercer concepto por considerar, de género matemático, está constituido por las diferentes técnicas de avalúo de proyectos de inversión, que integran los fundamentos de ingeniería económica y varios métodos de avalúo de proyectos, aplicables tanto a campos en desarrollo como en áreas exploratorias.
