Civil Engineering Blog: Reinforced concrete Design ... In the design and analysis of reinforced concrete members, you are presented with a problem unfamiliar to most of you: "The mechanics of members consisting

of two materials." To compound this problem, one of the materials (concrete) behaves differently in tension than in compression. Reinforced concrete is a composite material in which concrete's relatively low tensile strength and ductility are counteracted by the inclusion of reinforcement having higher tensile strength and/or ductility that a strong reason of today most of engineers are use reinforced concrete.

 Reinforced concrete can be precast or cast-in-place concrete, and is used in a wide range of applications such as; slab, wall, beam, column, foundation, and frame construction.

Reinforcement is generally placed in areas of the concrete that are likely to be subject to tension, such as the lower portion of beams.
