Life Drawing for Artists teaches a contemporary approach to figure drawing that includes both the familiar poses—standing, sitting, lying down—but also how to capture figures in movement and in more dynamic and engaging positions. Author Chris Legaspi is a dedicated, life-long artist and admired instructor who is known for his dynamic figurative drawings and paintings, and as a successful illustrator in the entertainment industry. Whether you are an aspiring illustrator, art student, or a professional artist looking to develop your abilities, Life Drawing for Artists shows how to build your skills by combining fundamental building blocks, such as gesture lines, shape and design, structure, value control, and edge or line control. You'll focus on different skills while working on both quick timed drawings and longer detailed drawings. The book covers important topics, such as drawing different views, understanding perspective, foreshortening strategies, and how to deal with various lighting conditions. The examples and tutorials explore virtually every pose scenario, as well as many active and dynamic movements. Breathe drama into your figures as you master the fundamentals with this fresh approach to life drawing. The For Artists series expertly guides and instructs artists at all skill levels who want to develop their classical drawing and painting skills and create realistic and representational art.

Along with plan and elevation, section is one of the essential representational techniques of architectural design; among architects and educators, debates about a project's section are common and often intense. Until now, however, there has been no framework to describe or evaluate it. Manual of Section fills this void. Paul Lewis, Marc Tsurumaki, and David J. Lewis have developed seven categories of section, revealed in structures ranging from simple one-story buildings to complex structures

featuring stacked forms, fantastical shapes, internal holes, inclines, sheared planes, nested forms, or combinations thereof. To illustrate these categories, the authors construct sixty-three intricately detailed cross-section perspective drawings of built projects—many of the most significant structures in international architecture from the last one hundred years—based on extensive archival research. Manual of Section also includes smart and accessible essays on the history and uses of section.

If engineering is the art and science of technical problem solving, systems architecting happens when you don't yet know what the problem is. The third edition of a highly respected bestseller, The Art of Systems Architecting provides in-depth coverage of the least understood part of systems design: moving from a vague concept and limited resources to a satisfactory and feasible system concept and an executable program. The book provides a practical, heuristic approach to the "art" of systems architecting. It provides methods for embracing, and then taming, the growing complexity of modern systems. New in the Third Edition: Five major case studies illustrating successful and unsuccessful practices Information on architecture frameworks as standards for architecture descriptions New methods for integrating business strategy and architecture and the role of architecture as the technical embodiment of strategy Integration of process guidance for organizing and managing architecture projects Updates to the rapidly changing fields of software and systems-of-systems architecture Organization of heuristics around a simple and practical process model A Practical Heuristic Approach to the Art of Systems Architecting Extensively rewritten to reflect the latest developments, the text explains how to create a system from scratch, presenting invention/design rules together with clear explanations of how to use them. The author supplies practical guidelines for avoiding common systematic failures while implementing new mandates. He uses a heuristics-based approach that provides an organized attack on very ill-structured engineering problems. Examining architecture as more than a set of diagrams and documents, but as a set of decisions that either drive a system to success or doom it to failure, the book provides methods for integrating business strategy with technical architectural decision making.

Draw In Order to See is the first book to survey the history of architectural design using the latest research in cognitive science and embodied cognition. Beginning with a primer on visual perception, cognitive science, design thinking, and modes of conception used by groups of architects in their practices, Mark Alan Hewitt surveys a 12,000-year period for specific information about the cognitive schemata used by Homo sapiens to make their buildings and habitats. The resulting history divides these modes of thinking into three large cognitive arcs: crafting, depicting, and assembling, within specific temporal frames. His analysis borrows from Merlin Donald's thesis about mimetic and symbolic cognition as critical to the emergence of the modern mind, and further employs theories of enactment and embodiment to clarify their relationship to architecture. Individual chapters treat the emergence of depiction during the Renaissance, the education of architects in the modern era, Baroque illusionism and scenography, the breakdown of artisanal literacy during the Enlightenment, and modern experiments with models, montage, and illusions of movement. The author concludes with a critique of contemporary design and education, and promotes design with embodiment as a tonic for a profession in crisis, facing the challenges of climate change, energy shortages, inequality, and housing a population of over seven billion in the coming decades. This groundbreaking and valuable study presents a clear view of current research in two related fields that have not heretofore been compared, and outlines a strategy for future research. An extensive bibliography offers readers an up-to-date reference to both the science and the architectural history behind the text.

**Practical Problems in Mathematics for Carpenters** Delmar Pub

Drawing Futures brings together international designers and artists for speculations in contemporary drawing for art and architecture. Despite numerous developments in technological manufacture and computational design that provide new grounds for designers, the act of drawing still plays a central role as a vehicle for speculation. There is a rich and long history of drawing tied to innovations in technology as well as to revolutions in our philosophical understanding of the world. In reflection of a society now underpinned by computational networks and interfaces allowing hitherto unprecedented views of the world, the changing status of the drawing and its representation as a political act demands a platform for reflection and innovation. Drawing Futures will present a compendium of projects, writings and interviews that critically reassess the act of drawing and where its future may lie. Drawing Futures focuses on the discussion of how the field of drawing may expand synchronously alongside technological and computational developments. The book coincides with an international conference of the same name, taking place at The Bartlett School of Architecture, UCL, in November 2016. Bringing together practitioners from many creative fields, the book discusses how drawing is changing in relation to new technologies for the production and dissemination of ideas.

**Site-Focused Management for Builders** CRC Press

This second edition is fully revised and updated and includes new chapters on sustainability, history and archaeology, designing through drawing and drawing in architectural practice. The book introduces design and graphic techniques aimed to help designers increase their understanding of buildings and places through drawing. For many, the camera has replaced the sketchbook, but here the author argues that freehand drawing as a means of analyzing and understanding buildings develops visual sensitivity and awareness of design. By combining design theory with practical lessons in drawing, *Understanding Architecture Through Drawing* encourages the use of the sketchbook as a creative and critical tool. The book is highly illustrated and is an essential manual on freehand drawing techniques for students of architecture, landscape architecture, town and country planning and urban design.
