As the involvement of information technology and soft infrastructure enhances in the modern day, there has been a number of issues which need a clear and accurate attention. Hacking is one such issue. Hackers have long operated as some unseen, hidden, and malicious force, but as knowledge and information

enhances day by day, so now the domain of computer sciences and information technology is also trying to address this topic and enable the users to gain knowledge about hacking and enhancing their system's security. In this book I have discussed the hacker's domain in a common man's language. Starting from the most basic level is significant in achieving a greater level of success. So as hacking is prevalent and common nowadays, so everyone should have knowledge about it. Even though hacking pertains to a vast area of knowledge and issues, the major topics which will be presented in a detailed and elaborate way include the following: A preliminary account of hacking, as a regime of information technology knowledge and its connections and

areas of concern which need to be discussed and explored. The basic activities which hackers perform. A step-by-step discussion of activities which are followed by hackers during any hacking venture. A Trojan horse or Trojan is a type of malware that is often disguised as legitimate software. Trojans can be employed by cyber-thieves and hackers trying to gain access to users' systems. Users are typically tricked by some form of social engineering into loading and executing Trojans on their systems. Once activated, Trojans can enable cyber-criminals to spy on you, steal your sensitive data, and gain backdoor access to your system. A computer virus is a type of computer program that, when executed, replicates itself by modifying other computer programs and inserting its own code. If this replication succeeds, the affected areas are then said to be

"infected" with a computer virus. Computer viruses generally require a host program. System hacking is defined as the compromise of computer systems and software to access the target computer and steal or misuse their sensitive information. Here the malicious hacker exploits the weaknesses in a computer system or network to gain unauthorized access to its data or take illegal advantage. Web content is generated in real time by a software application running at server-side. So hackers attack on the web server to steal credential information, passwords, and business information by using DoS (DDos) attacks, SYN flood, ping flood, port scan, sniffing attacks, and social engineering attacks. This report covers the common techniques and tools used

for System, Windows, Linux and Web Server Hacking. The report contains from the following sections: · Part A: Setup Lab: · Part B: Trojens and Backdoors and Viruses · Part C: System Hacking · Part D: Hacking Web Servers · Part E: Windows and Linux Hacking

Our world is increasingly driven by sophisticated networks of advanced computing technology, and the basic operation of everyday society is becoming increasingly vulnerable to those networks' shortcomings. The implementation and upkeep of a strong network defense is a substantial challenge, beset not only by economic disincentives, but also by an inherent logistical bias that grants advantage to attackers. Network Security Attacks and Countermeasures discusses the security and optimization of computer networks

for use in a variety of disciplines and fields. Touching on such matters as mobile and VPN security, IP spoofing, and intrusion detection, this edited collection emboldens the efforts of researchers, academics, and network administrators working in both the public and private sectors. The digital world is developing rapidly and furiously, and there is a need to secure data at every stage. Since

everything - personal information, bank information, friends, family, etc. is shared online now, data has to be secure at every point. Many cybercriminals are looking for opportunities to steal confidential data for many purposes, including conflict of interest, national security breach, terrorist activities, and so on. Ethical hacking services provide a solution to safeguard business and government networks from such attacks and provide high data security. We can prevent data from being stolen or misused through ethical hacking, identify vulnerabilities or weak points, implement secure networks, and protect the data. There are five main types of ethical hacking, and most of us know most of them: Web application hacking Web server hacking System hacking

Wireless network hacking Social engineering Each type of hacking requires certain skills, tools, and techniques, and the ethical hackers need to think just how an actual malicious hacker would for a thorough test. They should identify loopholes, know about penetration testing, use the appropriate tools to carry out the hack, and be prepared. Even if there is an actual attack, the loss is minimal. Social hacking describes the act of attempting to manipulate outcomes of social behaviour through orchestrated actions. The general function of social hacking is to gain access to restricted information or to a physical space without proper permission. Most often, social hacking attacks are achieved by impersonating an individual or group who is directly or

indirectly known to the victims or by representing an individual or group in a position of authority.[1] This is done through pre-meditated research and planning to gain victims' confidence. Social hackers take great measures to present overtones of familiarity and trustworthiness to elicit confidential or personal information.[2] Social hacking is most commonly associated as a component of "social engineering". Although the practice involves exercising control over human behaviour rather than computers, the term "social hacking" is also used in reference to online behaviour and increasingly, social media activity. The technique can be used in multiple ways that affect public perception and conversely, increase public awareness of social hacking

activity. However, while awareness helps reduce the volume of hacks being carried out, technology has allowed for attack tools to become more sophisticated. this book will tell you how the attacks will happen on you and in the next book we will tell you how will you save your self from the attackers.

The Art of Deception Pencil

Recent years have seen an increase in the number and severity of Information Operations (IO) attacks upon DoD resources. At a higher level, the US as a whole has come under cyber attack by individuals and groups seeking thrills, monetary gain, publicity for their causes, and myriad other goals. This effort develops a first cut model of individual hacker mentality that can be utilized to improve threat assessment, mitigate

Information Assurance (IA) vulnerabilities, and improve risk assessment. Further, it is a first step toward automated characterization of Information Warfare (IW) attacks based upon hacker types. All hackers are not the same. In order to best deal with their actions and the intent behind their actions, one must understand who they are. Many hackers are not malicious, in that they hack for the thrill of learning and to "look around". However, others are intent upon gathering information for gain (profit or intelligence aspects), corrupting data or denying access to the system, or to see what harm they can cause. Research for this effort specifically focused on malicious hackers working for nation states, although the basic framework presented applies in

part to any type of hacker. This results in advances in the way that hackers are classified and profiled, with a better understanding of their values, skills, and approaches to hacking. Responses can then be tailored to specifics of a given class of hackers. The model developed is illustrated by a case study.
