Case Studies in
Elementary and
Secondary Curriculum
provides 21 real-world
cases that provide the
opportunity for educators
to explore the different
perspectives that different
stakeholders take on the
concept of curriculum.
The cases examine how
curriculum comes to life
as a complex process
including the whole
continuum--ranging from
design to implementation
and evaluation--and how
this process can be
analyzed and changed.

This study aims is to
discover the best methods
for geometry students to
master proof writing.
Students who are taught
how to write proofs in a
traditional setting find
proofs to be very difficult.
Studies have been
conducted regarding the

use of dynamic geometry
software in proof writing.
To further study the
effects of proof writing
using dynamic geometry
software, freshmen
students enrolled in an
honors geometry course
at a high performing
suburban high school in
Louisiana were given
several proofs to
complete, along with self-
reflection surveys. During
phase one of this
research, twenty-four
students were allowed to
use Geometer's
Sketchpad while writing
their proofs, while the
other twenty-four
students were using only
paper and pencil to
explore the figure
involved in the proof.
During phase two of
testing, the control and
experimental groups
swapped places to uphold
the equality standards of
the course. Student self-
reflection surveys show
that some students enjoy
writing proofs when using
GSP, while others are
indifferent. Along with the
student surveys, the
present study is an
analysis of student work
from those who had
access to GSP to improve
proof writing skills.

Sixteen-year-old Mia Hughes is not really a bad girl. She's just made one bad decision after another, like mixing in with the wrong crowd and disappearing for days at a time. Her latest move has forced her parents to do the unthinkable—send her away to boarding school. Trying to make sense of her new world, far away from Pittsburgh, is only half the battle for Mia as she fights to survive the wicked ways of the rich, spoiled kids at Galt Academy. But Mia is a fighter, and when she befriends junior Lucas Dunlap, the cute coffee shop guy, and his friend, Natalie, things start to

look up for her—until the betrayal. After falling into a deep depression, Mia resorts to the one thing she does best: running away. There’s only one problem—Lucas has a hold on her. And just when Mia thinks life can’t get any more complicated, it does with some life-changing news. Can Mia keep her head above water long enough to survive the pressures of her new school? And will Lucas be there when she finally comes up for air, once and for all?

Understanding Elementary Algebra with Geometry IAP

Although there are many textbooks in the field of educational administration describing various organizational theories, this text is unique in tying organizational theory explicitly and systematically to a well-formulated problem-analysis methodology. It provides particular examples of bureaucratic, political, and leadership theories as well as descriptions of two broader theoretical frameworks: Burrell and Morgan's conceptual matrix and systems thinking. Special features include: * a fully developed methodology

for describing and documenting problems in schools; * a systematic method for using different theoretical perspectives to analyze the causes of problems in schools; * carefully formulated questions illustrating how different theoretical frameworks lead policy analysts to look at problems differently and to focus on different types and sources of information concerning their possible causes; * substantial sample papers illustrating the methodology; and * a range of illustrative organizational theories, amply described and succinctly grounded intellectually. This book is directed toward students in organizational theory and problem analysis classes and their professors, as well as to school administrators seeking to examine their problems and policies from perspectives that go beyond personal experience.

Now in paperback, Paine's essential American

writings in authoritative Library of America texts: After a life of obscurity and failure in England, Thomas Paine came to America in 1774 at age 37. Within fourteen months he published *Common Sense*, the most influential pamphlet of the American Revolution, and began a career that would see him hailed and reviled in the American nation he helped create. In *Common Sense*, Paine sets forth an inspiring vision of an independent America as an asylum for freedom and an example of popular self-government in a world oppressed by despotism and hereditary privilege. *The American Crisis*, begun during “the times that try men’s souls” in 1776, is a masterpiece of popular pamphleteering in which Paine vividly reports current developments, taunts and ridicules British adversaries, and enjoins his readers to remember the immense stakes of their struggle. They are joined in this invaluable reader by a selection of Paine’s other American pamphlets and his letters to George Washington, Thomas Jefferson, and others. Introductory Statistics is designed for the one-semester, introduction to statistics course and is geared toward students majoring in fields other than math or engineering. This text assumes students have been exposed to intermediate algebra, and it focuses on the applications of statistical knowledge rather than the theory behind it. The foundation of this textbook is Collaborative Statistics, by Barbara Illowsky and Susan Dean. Additional topics, examples, and ample opportunities for practice have been added to each chapter. The development choices for this textbook were made with the guidance of many faculty members who are deeply involved in teaching this course. These choices led to innovations in art, terminology, and practical applications, all with a goal of increasing relevance and accessibility for students. We strove to make the discipline meaningful, so that students can draw from it a working knowledge that will enrich their future studies and help them make sense of the world around them. This book is a result of collaboration between NTLS and SITTE. Framing Research is targeted at individuals or small teams of educational researchers who are interested in conducting high quality research addressing the effects of technology-enhanced instruction on student learning. The book summarizes and unpacks the methodologies of a variety of research studies, each situated in the context of school subject areas, such as science, mathematics, social studies, and English/language arts, as well as in the contexts of reading education, special education, and early childhood learning. Taken together, the analyses provide guidance on the design of future technology research grounded in student learning of K12 curriculum. The conclusions also serve as a tool for teacher educators seeking to prepare teachers to integrate technology effectively in their instruction and to motivate reluctant teachers to overcome perceived inconveniences connected with technology use. *Common Core* Peterson's

This study examines the relationship between how often students retake assessments and their study habits in mathematics. A sample of Honors Geometry students was selected from a school district in the Northeast that has an assessment retake policy. Surveys were given to gather data on students' study habits, titled "Math Study Skills/Habits Inventory" (MSSHI). Data was collected on those students who chose to retake assessments by means of a form titled "Request to Retest." A Wilcoxon rank-sum test was performed to see whether there was a difference in study habits (based on the total MSSHI score) between two groups- those students who retook an assessment at least once during the first semester, and those students who did not retake any assessments (although some could have). Wilcoxon rank-sum and ANOVA tests were performed to see whether there was a significant difference between the same two groups under each category of the survey--time and place for studying, study strategies, test-taking strategies, and anxiety. The students that

retook assessments had a higher mean score on the MSSHI than those students who did not retake assessments. There was not a statistically significant difference found in the

mathematics study habits between those students who retook an assessment and those students who did not retake assessments. A significant positive

correlation was found between the scores that students who retook assessments received on the MSSHI and the improvement that they earned between their original and retake score.
