That is why data mining is so important. In this point, the next question would be: so, how data mining is used to generate Business Intelligence? Nowadays, data mining is primarily used by companies with a strong consumer view. How Data mining is used to generate Business Intelligence Data mining is

the process of finding anomalies, patterns and correlations within large data sets to predict outcomes. Using a broad range of techniques, you can use this information to increase revenues, cut costs, improve customer relationships, reduce risks and more. What is data mining? | SAS Data mining is the process of discovering patterns in large data sets involving methods at the intersection of machine learning, statistics, and database systems. Data mining is an

interdisciplinary subfield of computer science and statistics with an overall goal to extract information (with intelligent methods) from a data set and transform the information into a comprehensible structure for ...
