Minimax Approximation And Remez Algorithm  
Figure 1: Example of a minimax third order polynomial that conforms to the Chebychev criteria The minimax polynomial can be computed analytically up to  $n = 1$ . For higher order a numerical method due

to Remez [2] has to be employed. Remez algorithm is an iterative algorithm. We start the first iteration Minimax Approximation and Remez Algorithm Minimax Approximations and the Remez Algorithm The directory `libs/math/minimax` contains a command line driven program for the generation of minimax approximations using the Remez algorithm. Both polynomial and rational approximations are supported, although the latter are tricky to converge: it is not uncommon for convergence of rational forms to fail. Minimax Approximations and the Remez Algorithm - 1.49.0 Truncated Chebyshev series, however, closely approximate the minimax polynomial. One popular minimax approximation algorithm is the Remez algorithm. External links. Minimax approximation algorithm at MathWorld; References Minimax approximation algorithm - Wikipedia The Remez algorithm is an iterative procedure which can be used to find best polynomial approximations in the minimax sense. We present and explain relevant theory on minimax approximation. After doing so, we state the Remez algorithm and give several examples created by our Matlab implementation of the algorithm. We conclude by presenting a Finding best minimax approximations with the Remez algorithm this concludes Minimax approximation. However the task of constructing a minimax polynomial is not trivial. For a given function  $f$ , Remez algorithm is an efficient iterative algorithm that constructs a minimax polynomial. However as simple as they are, polynomials on their own don't capture all the classes of functions we want to approximate [10]. FUNCTION APPROXIMATION AND THE REMEZ ALGORITHM The Remez algorithm is an iterative procedure which can be used to find best polynomial approximations in the

THE REMEZ ALGORITHM The Remez algorithm or Remez exchange algorithm, published by Evgeny Yakovlevich Remez in 1934, is an iterative algorithm used to find simple approximations to functions, specifically, approximations by functions in a Chebyshev space that are the best in the uniform norm  $L_\infty$  sense. A typical example of a Chebyshev space is the subspace of Chebyshev polynomials of order  $n$  in the space of ... Remez algorithm - Wikipedia I am trying to find the minimax polynomial approximation for sine and cosine using the Remez exchange algorithm in MATLAB.
