The rise of the Japanese multinational company (JMNC) marked, from the 1980s onwards, an historic change in the structure and in the dynamics of the international economy. For the first time, businesses from a non-Western nation established a competitive global presence, and they did so by bringing their advanced products and management systems to the developed economies of Europe and North America. In the last 30 years, our interpretations of JMNCs have undergone a series of revisions. Korean firms followed JMNCs in the 1990s and the Chinese likewise in the 2000s. A seeming decline in JMNC competitiveness and developments in the structure of the international economy challenged a business model of parental company direction, control and capabilities. Both trends asked questions about how Japanese subsidiaries should operate in global production chains increasingly reliant on contracting out and off-shoring, and how JMNCs might engage more in strategic cooperation and empower subsidiary decision-making. The contributors to this volume consider a wide range of relevant issues: they demonstrate the long-term evolution of JMNCs; they compare the experience of JMNCs with firms from the other two major Asia Pacific economies, Korea and China; they evaluate the applicability of established foreign direct investment (FDI) theory to MNCs from Japan and the Asia Pacific; and they reflect on the internal organization of JMNCs at the global, national and subnational level. This book was originally published as a special issue of *Asia Pacific Business Review*.

The automobile is an icon of modern technology because it includes most aspects of modern engineering, and it offers an exciting approach to engineering education. Of course there are many existing books on introductory fluid/aero dynamics but the majority of these are too long, focussed on aerospace and don't adequately cover the basics. Therefore, there is room and a need for a concise, introductory textbook in this area. Automotive Aerodynamics fulfils this need and is an introductory textbook intended as a first course in the complex field of aero/fluid mechanics for engineering students. It introduces basic concepts and fluid properties, and covers fluid dynamic equations. Examples of automotive aerodynamics are included and the principles of computational fluid dynamics are introduced. This text also includes topics such as aeroacoustics and heat transfer which are important to engineering students and are closely related to the main topic of aero/fluid mechanics. This textbook contains complex mathematics, which not only serve as the foundation for future studies but also provide a road map for the present text. As the chapters evolve, focus is

placed on more applicable examples, which can be solved in class using elementary algebra. The approach taken is designed to make the mathematics more approachable and easier to understand. Key features: Concise textbook which provides an introduction to fluid mechanics and aerodynamics, with automotive applications Written by a leading author in the field who has experience working with motor sports teams in industry Explains basic concepts and equations before progressing to cover more advanced topics Covers internal and external flows for automotive applications Covers emerging areas of aeroacoustics and heat transfer Automotive Aerodynamics is a must-have textbook for undergraduate and graduate students in automotive and mechanical engineering, and is also a concise reference for engineers in industry.
