Nursing informatics has a long history of focusing on information management and nurses have a long history of describing their computer use. However, based on the technical advances and through the ongoing and consistent changes in healthcare today, we are now challenged to look to the future and help determine what nurses and patients/consumers will need going forward. This book presents the proceedings of the Post Conference to the 13th International Conference on Nursing Informatics, held in Geneva, Switzerland, in June 2016. The theme of the Post Conference is Forecasting Informatics Competencies for Nurses in the Future of Connected Health. This book includes 25 chapters written as part of the Post Conference; a result of the collaboration among nursing informatics

experts from research, education and practice settings, from 18 countries, and from varying levels of expertise - those beginning to forge new frontiers in connected health and those who helped form the discipline. The book content will help forecast and define the informatics competencies for nurses in practice, and as such, it will also help outline the requirements for informatics training in nursing programs around the world. The content will aid in shaping the nursing practice that will exist in our future of connected health, when practice and technology will be inextricably intertwined.

Medical education — the art and science behind medical teaching and learning — has progressed remarkably. Teaching and learning have become more scientific and rigorous, curricula are based on sound

pedagogical principles, and problem-based and other forms of active and self-directed learning have become the mainstream.

We have progressed from the role of problem-identifier to that of solution-provider. This book provides a balanced overview of the “why” of medical education, emphasizing the need for change and adaptation, and the “how”, by demonstrating the way concepts and theories of medical education can be of immediate benefit to the medical teacher. In this improved second edition, student assessment, curriculum, outcome-based education, clinical teaching, and problem-based learning receive more emphasis with the addition of new chapters, essential updates, and consolidation. The tone is more pragmatic, with implementable examples and incorporation of newer evidence and better practices. However, one thing has not changed: the book still targets medical teachers without a formal background in education.
