Descriptive geometry
Sagwan Press

Excellent for engineering
and technology students,
this text goes far beyond
instruction in standard
orthographic projection to
clarify all the tools of

descriptive geometry--and
how they apply to
individual fields. The text
places special emphasis
on applications in all the
various engineering
disciplines: mechanical,
plastics, industrial, piping,
aerospace, marine, civil,
and structural. As a result,
students quickly grasp the
value of descriptive
geometry as they apply
the tools and techniques
to practical problems. By
organizing information
around the field's central
concept--line of sight--the
presentation facilitates
understanding in a way
unmatched by any other
text. The worktext format
provides students with all
the resources they need--
text and workbook--under
one cover. ALSO

Descriptive Geometry for
Students of Engineering
Delmar Pub

Excerpt from Descriptive
Geometry for Students in
Engineering Science and
Architecture: A Carefully
Graded Course of
Instruction Section 1. In
Descriptive Geometry the
object is chiefly to

prepare drawings as
follows: - (a) Those which
will display or describe by
different views any object
or arrangement of lines or
figures discussed; (b)
Those which will, by
various analytical and
constructive methods and
operations, discover or
disclose facts as to
shapes, inclinations,
appearances, sizes, etc.;
and (c) Those which will
represent planes and how
they may be disposed to
one another. The views
mentioned above in (a)
are projections, and are
made on what are called
planes of projection. The
same projection planes,
two in number, are also
made use of in the
discussion of planes
referred to in (c), lines
being drawn over the
planes of projection and
made to represent other
planes in various attitudes
with respect to the
projection planes. The
planes of projection are
the Horizontal Plane and
the Vertical Plane. These
are considered as being
fixed, and the lines,
planes, figures or objects
are considered as having
a relation to them - near
or otherwise as to
distance, inclined or
otherwise as to altitude.
The drawings made either

represent points, lines, figures or objects by views thrown perpendicularly on to these planes of projection (the H.P. and the V.P. as they are commonly called), or they indicate the intersection of the planes of projection by lines and planes. Excerpt from *Elementary Descriptive Geometry* The object of this volume is to put into concise form what the Author considers the minimum requirement of knowledge of the subject of Descriptive Geometry for students

entering on an engineering course. It is desirable where possible that the text should be supplemented by blackboard demonstration and individual classroom instruction. The student should bear in mind that a thorough understanding of the methods of descriptive geometry is necessary to the proper interpretation of constructive drawing, and that in his study of the subject he should aim at grasping the methods rather than, at learning special text-book problems. Descriptive Geometry

Forgotten Books
Excerpt from Brief Synopsis of the Course of Lectures in Descriptive Geometry: As Arranged for the Second Year Faculty of Applied Science and Engineering, University of Toronto
In problems in descriptive geometry, curves like other lines are usually represented by their projections. If a curve of single curvature have its plane perpendicular to a plane of projection, its projection on that plane is a straight line. If the plane of the curve be parallel to the plane of projection, the projection will be of exactly the same form as the curve itself. The projection of a curve of double curvature can never be a straight line or of the same form as the curve itself. About the
