One of the most important challenges that people in senior management positions face is the responsibility of ensuring their organizations' effective practice of performance management. As this book reveals, performance management comprises an interdisciplinary field of study and practice that draws upon a wide set of business disciplines, including strategic management, organizational behaviour, organizational theory, and management

accounting. This book provides a contemporary examination of theories, issues, and practices related to performance management. An original performance management framework helps structure the book, and in particular the ordering and layout of the book's chapters. Unlike other performance management frameworks, the one used here is grounded in concrete organizational phenomena, therefore making it more accessible and meaningful to practitioners, scholars, and students.

One of the main aims of management accounting is to provide managers with accurate information in order to provide a good basis for decision-making. There is evidence that the information provided by management accounting systems (MAS) is distorted and the occurrence of biases in accounting information is widely accepted among users of MAS. At the same time, the intensity and the frequency of use of MAS increase, too. Consequently, the quality of the provided information is critical. The focus of this simulation study is twofold. On the one hand, the impact of the sophistication of traditional costing systems on error propagation in the case of a set of input biases is investigated. On the other hand, the impact of single and multiple input biases on the quality of the information provided by traditional costing systems is focused. In order to investigate the research questions, a simulation approach is applied.
