 Introduction to Fluid

 The goal of this text is to  
 present some of the basic  
 ideas of fluid mechanics in  
 a mathematically  
 attractive manner, to  
 present the physical  
 background and  
 motivation for some  
 constructions that have  
 been used in recent

mathematical and  
 numerical work on the  
 Navier-Stokes equations  
 and on hyperbolic  
 systems and to interest

 mathematical manner so  
 that much that remains  
 uninvestigated in  
 standard fluids texts is

MECHANICS 3 The cross product is only between two vectors in three space dimension. Let  $v = (v_1; v_2; v_3)$ ,  $u = (u_1; u_2; u_3)$   $\in \mathbb{R}^3$ . Then the cross product is defined by  $v \times u = (v_2 u_3 - v_3 u_2; v_3 u_1 - v_1 u_3; v_1 u_2 - v_2 u_1)$ : (0.5)

It is convenient to consider the operator for the gradient as  $\nabla = (\frac{\partial}{\partial x_1}; \frac{\partial}{\partial x_2}; \frac{\partial}{\partial x_3})$ . Then,  $\nabla \cdot c = \frac{\partial c}{\partial x_1}; \frac{\partial c}{\partial x_2}; \frac{\partial c}{\partial x_3}$  Notations Introduction.

These notes are based on a one-quarter (i. e. very short) course in fluid mechanics taught in the Department of Mathematics of the University of California, Berkeley during the Spring of 1978. The goal of the course was not to provide an exhaustive account of fluid mechanics, nor to assess the engineering value of various approximation procedures.

A Mathematical Introduction to Fluid Mechanics presents some selected highlights of currently interesting topics in fluid mechanics

in a compact form, as well as providing a concise and appealing exposition of the basic theory of fluid mechanics. The first chapter contains an elementary derivation of the equations, and the concept of vorticity is introduced.
