 The fourth edition of the essential guide to the contemporary US health care system. Winner of the CHOICE Outstanding Academic Title of the Choice ACRL Health care reform has been a dominant theme in public discourse for decades now. The passage of the Affordable Care Act was a major milestone, but rather than quell the rhetoric, it has sparked even more heated debate. In the latest edition of Introduction to US Health Policy, Donald A. Barr reviews the current structure of the American health care system, describing the historical and political contexts in which it developed and the core policy issues that continue to confront us today. Barr's comprehensive analysis explores the various organizations and institutions that make the US health care system work—or fail to work. He describes in detail the paradox of US health care—simultaneously the best in the world and one of the worst among developed countries—while introducing readers to broad cultural issues surrounding health care policy, such as access, affordability, and quality. Barr also discusses specific elements of US health care with depth and nuance, including insurance, especially Medicare and Medicaid. He

scrutinizes the shift to for-profit managed care while analyzing the pharmaceutical industry, issues surrounding long-term care, the plight of the uninsured, the prevalence of medical errors, and the troublesome issue of nursing shortages. The thoroughly updated edition of this widely adopted text focuses on the Affordable Care Act. It explains the steps taken to carry out the Act, the changes to the Act based on recent Supreme Court decisions, the success of the Act in achieving the combined goals of improved access to care and constraining the costs of care, and the continuing political controversy regarding its future. Drawing on an extensive range of resources, including government reports, scholarly publications, and analyses from a range of private organizations, Introduction to US Health Policy provides scholars, policymakers, and health care providers with a comprehensive platform of ideas that is key to understanding and influencing the changes in the US health care system.

Comparative Case Studies: New Designs and Directions extends the comparative case study methodology established by Bartlett and Vavrus and employed in many areas of social research, especially in education. This volume unites a diverse, international group of education scholars whose work exemplifies the affordances and constraints of the comparative case study (CCS) approach and offers new theoretical and empirical directions for researchers. In 11 engaging chapters, experts in comparative education, early childhood education, peace education, refugee education, special

education, and teacher education discuss their use of the CCS approach to produce new ways of knowing and to address challenges of multi-scalar and multi-sited research. The first section, *Conceptualizing Cases and Case Selection*, emphasizes the importance of carefully selecting cases during different phases of research while continuously reflecting on how these choices influence the findings. The second section, *Balancing Specificity and Generalizability*, addresses the challenge of balancing the need for rich, deep data while including multiple sites. The third section, *Enabling Processual Analysis across Sites and Scales*, demonstrates the fit between the CCS approach and qualitative research that unfolds over time and space. Addressing the *Transversal Axis*, the fourth section, showcases research with a strong temporal dimension. The final section, *New Directions*, suggests inspiring and innovative methods. Offering rich methodological examples and provocative discussion questions, this volume will appeal to undergraduate and graduate students in education and research design courses, and to scholars and policymakers in diverse fields seeking to design studies of complex phenomena at different sites and scales.

Fusion, Volume I: Magnetic Confinement, Part B is the second of the two-part volume that covers the complexity and application of controlled magnetic fusion. This part is composed of nine chapters and begins with a description of the heating methods, equilibrium, and stability of linear magnetic fusion systems. The next chapters deal with the principles, configuration, and application of high-beta stellarator, fast-linear-compression fusion systems, and ELMO Bumpy torus, as well as the magnetic confinement of high-temperature plasmas. These topics are followed by discussions of the neutral-beam injection; the regimes of radio-frequency heating of magnetically confined plasma; and the performance requirements of magnetic fusion reactors. The final chapters describe the basic processes in the fusion-fission fuel factory and some basic considerations for advanced-fuel reactors. This book will be of great value to physicists, physics students, and researchers.
