In the past few years, more and more employees have been demanding to do work from iPhones, iPads, and Android devices. Back in days of BlackBerry, dealing with mobility was easy. However, these new devices aren't so easy to manage, and the tasks that employees are doing are far more advanced. In addition, now we also have to grapple with the trend of BYOD--personal devices in the workplace. The enterprise mobility management (EMM) industry has responded with technologies like mobile device management (MDM), mobile app management (MAM), mobile virtualization, app wrapping, "containerization," and mobile file syncing. All this technology is new, and it's evolving rapidly. The stakes are high: Thanks to the consumerization of IT, if enterprise IT doesn't figure mobility, user will bring in their own phones and tablets and do whatever they want. "Enterprise Mobility Management: Everything you need to know about MDM, MAM, and BYOD" is your guide to figuring out how it all works. In this book, readers will learn: How MDM really works, what it does well, and what its limitations are; Why IT's mindset has to evolve from locking down devices and networks to making data and applications accessible in a safe way; Why the real challenge isn't personal devices, but mixing work and personal apps and data on a single device, regardless of whether they're personally-owned or corporate-deployed; How mobile app management work, and why, despite challenges, it may be the best approach for keeping corporate data secure; And how future developments could affect approaches to enterprise mobility management. This book is for people who have been tasked with "figuring out BYOD." It's for companies that for years have dealt with only BlackBerry and BlackBerry Enterprise Server (BES) and want to know what's next. It's for desktop admins and architects who are now tasked with delivering applications and data to new platforms. It's for the mobile managers who were happy with BES for the past 10 years and now have to deal with users bringing in iPhones.

The enterprise mobility management (EMM) has recently become a hot topic for business organizations. Enterprises have seen how the introduction of tablets and smartphones to corporate jobs, has supposed in one hand to some a revolution to the way some business are done, while on the other hand has also uncovered serious deficiencies for securing and access control. This document was created as a response to the imperative need to manage and remotely control devices, applications and content its have access. The initial objectives have been: Study the main characteristics about enterprise mobility and why is needed to manage it. Analyse business mobility requirements and define an Enterprise Mobility Management strategy. Compare, select and implement an Enterprise Mobility Management System and evaluate if it satisfies the needs proposed previously. For its elaboration, has been used a methodology based on phases. First, has developed an intense fieldwork to analyse the requirements of mobility in a real case study. Next, have designed a solution based on an Enterprise Mobility Management System (EMMS) that fulfil all the needs identified previously. Finally, based on previous studies, has been developed a laboratory where put in practice all the management and control techniques studied. At the project ends, the following conclusions have been reached: Companies have much benefits to gain from learn how to develop their activities in a mobility ecosystem. Instead of manifesting an attitude of resistance to this phenomenon, it is better to adopt a constructive and collaborative thinking. Therefore to define the EMM program, it is necessary to analyse the company and its business, having business units forwarding to IT how they consume, create, collaborate and communicate with their activities in order to respond to their mobility needs. Manage a heterogeneous device platform is a big management, maintenance and support challenge. It is therefore essential to identify that Enterprise Mobility Management System which best adapt to the needs required, if necessary making a deep comparison between the different options on the market. EMM solutions must be able to keep under control the device and its contents during the whole life cycle, from delivery to withdrawal. To do EMMS capabilities must include Mobile Device Management, Mobile Application Management and Mobile Content Management. These systems by themselves suppose improvements to the management and security, but are not relevant at the level of productivity and efficiency until its integration with corporate services. This is definitely the "leitmotiv" of this type of solutions. But this part also is the most difficult because when many systems currently on the companies was implanted, not taken into account its use in other conditions different from the traditional PC.
