Backpropagation and Lecture 4: Neural Networks

Lecture 4: Backpropagation Roger Grosse 1 Introduction So far, we've seen how to train "shallow" models, where the predictions are computed as a linear function of the inputs. We've also observed that deeper models are much more powerful than linear ones, in that they can compute a broader set of functions.

Neural Networks and Lecture 4: Backpropagation

the big picture behind neural networks. Section 4: feed-forward neural networks implementation. gradient descent with back-propagation. In the first part of the course you will learn about the theoretical background of neural networks, later you will learn how to implement them in Python from scratch.

Lecture 4: Backpropagation and AutomaticDifferentiation

The backpropagation learning algorithm operates based on the following steps. In step one, it forward propagates the training pattern's input through the neural network, starting from the input side going through the hidden layers. And in step two, the neural network generates the initial output values over here at the output.
