Introduction to Criminal Justice Information Systems Newnes
 The proliferation of information systems throughout the criminal

justice system has prompted many universities supporting
 criminal justice programs to add criminal justice information
 systems technology to their curriculums. Several universities
 have gone so far as to hire professors with specializations in
 information technology and to offer criminal justice information
 systems as an area of concentration. Introduction to Criminal
 Justice Information Systems gives an overview of the various
 software systems and technologies currently used in the criminal
 justice environment. The book covers a variety of topics critical to
 each member of the criminal justice system: police, prosecutor,
 courts, and corrections. It details the current systems in use, how
 they are used, and how separate systems interact with others. It
 also suggests how the current technology and the processes built
 upon it will evolve. While designed as a textbook to meet the
 needs of an introductory criminal justice information technology
 course, Introduction to Criminal Justice Information Systems is
 also a flexible resource useful to professionals in relevant areas
 of the criminal justice system. With rapidly increasing

development and use of technology in modern law enforcement, this book provides a much-needed reference for those who are responsible for its implementation as well as an essential introduction to those who will become responsible for it. An instructor's manual is available as an electronic download upon request.

The goal of Introduction to Information Systems, 3rd Canadian Edition remains the same: to teach all business majors, especially undergraduate ones, how to use information technology to master their current or future jobs and to help ensure the success of their organization. To accomplish this goal, this text helps students to become informed users; that is, persons knowledgeable about information systems and information

technology. The focus is not on merely learning the concepts of IT but rather on applying those concepts to facilitate business processes. The authors concentrate on placing information systems in the context of business, so that students will more readily grasp the concepts presented in the text. The theme of this book is What's In IT for Me? This question is asked by all students who take this course. Though mathematical ideas underpin the study of neural networks, the author presents the fundamentals without the full mathematical apparatus. All aspects of the field are tackled, including artificial neurons as models of their real counterparts; the geometry of network action in pattern space; gradient descent methods, including back-propagation; associative memory and Hopfield nets; and self-organization and feature maps. The traditionally difficult topic of adaptive resonance theory is clarified within a hierarchical description of its operation. The book also includes several real-world examples to provide a concrete focus. This should enhance its appeal to those involved in the design, construction and management of networks in commercial environments and who wish to improve their understanding of network simulator packages. As a comprehensive and highly accessible introduction to one of the most important topics in cognitive and computer science, this volume should interest a wide range of readers, both students and professionals, in cognitive science, psychology, computer science and electrical engineering.
