In multibody systems, there are not only holonomic bilateral constraints, but also unilateral constraints. The existence of unilateral constraints brings nonsmooth contact dynamic problems into multibody dynamic systems. In this paper, we present an approach based on the symplectic method and the linear complementary method to solve multibody dynamic problems with impact contact. Non-smooth mechanics is a modeling approach in mechanics which does not require the time evolutions of the positions and of the velocities to be smooth functions

anymore. Due to possible impacts, the velocities of the mechanical system are even allowed to undergo jumps at certain time instants in order to fulfill the kinematical restrictions. Non-smooth mechanics - Wikipedia The numerical method is particularly suitable for nonsmooth structures. A phase resonance approach for nonlinear experimental modal analysis is applied. Typically nonsmooth dynamical strategies are represented as differential inclusions, complementarity methods, evolution variational inequalities, each of these programs itself being minimized up into various subclasses. The book is cut up into four parts, the first three parts being sketched in Fig. zero.
