StarBriefs 2001 Springer

As a companion to books on project-management theory, this book illustrates, in a down-to-earth, comprehensive style, how to put that theory into practice. In addition to the many examples that illustrate procedures, the book includes over 25 case studies, each one addressing a specific theme. Key topics, such as project selection, negotiations, planning and scheduling, cost and budgeting, project control, human resources, environmental impacts, risk management, and financial evaluation, are discussed, using a step-by-step approach. Beginning at the grassroots level, some cases are solved by hand to illustrate the mechanics of a procedure, while others are solved using advanced computer programs. In this way the reader has a clear idea of the problem, how and when to raise the issue, information needed (and who can provide it), how to solve it by hand, when possible, and also its resolution using the latest informatics tools.

It is clear that the development of large software systems is an extremely complex activity, which is full of various opportunities to introduce errors. Software engineering is the discipline that provides methods to handle this complexity and enables us to produce reliable software systems with maximum productivity. An Integrated Approach to Software Engineering is different from other approaches because the various topics are not covered in isolation. A running case study is employed throughout the book, illustrating the different activity of software development on a single project. This work is important and instructive because it not only teaches the principles of software engineering, but also applies them to a software development project such that all aspects of development can be clearly seen on a project.

Construction Project Management: An Integrated Approach is a management approach to leading projects and the effective choice and use of project management tools and techniques. It seeks to push the boundaries of project management to take on board future needs and user issues. Integration of the construction project, meaning closer relations between the project team, the supply chain and the client, is long overdue; however, despite some signs of growth in this area, the industry nonetheless remains fragmented in its approach. The role of the project manager is to integrate diverse interests and unify objectives to achieve a common goal. This has now broadened to include a responsibility, on the parts of both client and team, to ensure that construction addresses current and future societal needs. From an economic perspective, a great deal of waste is connected with conflict, thus a holistic approach that increases the efficiency and effectiveness of the task at hand will inject energy into project management. This third edition now takes on board the impact of technology in building information modelling and other digitised technologies such as artificial intelligence. Together, they open up avenues for more direct and incisive action to test creative design, manufacture directly and communicate spontaneously and intuitively. In time, such technologies will change the role of project managers but will never take away their responsibility to be passionate about construction and to integrate the team. A new chapter has been added that considers future societal needs. This edition is also reordered to make the project life cycle and process chapters clearer. This book combines best practice in construction with the theories underpinning project management and presents a wealth of practical case studies – many new. It focuses on all construction disciplines that may manage projects. The book is of unique value to students in the later years of undergraduate courses and those on specialist postgraduate courses in project management and also for practitioners in all disciplines and clients who have experienced the frustration caused by the fragmentation of construction projects.

The ICEBE conference held in Shijiazhuang is the seventh in a series of annual conferences on engineering and business education and ICIE is the 5th international conference that runs every two years on innovation and entrepreneurship. It is the fourth joint conference organised by the Robert-Schmidt-Institute (University Wismar), hosted by Shijiazhuang University of Economics and co-organized by La Consolacion College Manila. The theme of the conference is "Education Innovation and Economic Society Development" which describes the emphasis that is laid on always combining education with the need of the society, not only to consider one in isolation from the others. Therefore the primary target of the conference is to provide the delegates with cross-disciplinary interests related to the subjects above in engineering and business education.

The Food, Conservation, and Energy Act of 2008 directed the U.S. Dept. of Agr. to conduct a 1-year study to assess the extent of areas with limited access to affordable and nutritious food, identify characteristics and causes of such areas, consider how limited access affects local populations, and outline recommendations to address the problem. This report presents the findings of the study, which include results from two conferences of national and international authorities on food deserts and a set of research studies. It also includes reviews of existing literature, a national-level assessment of access to large grocery stores and supermarkets, analysis of the economic and public health effects of limited access, and a discussion of existing policy interventions. At a time when information systems are becoming ever more complex and quality to market and time to market are critical for many companies, a structured test process is essential. Even more important is a structured test management process to keep testing under control. Nowadays a test manager must have extensive knowledge of and experience with project management, risk assessment, team building, and process improvement. Based on their long-term industry experience, Pinkster and her coauthors describe a holistic approach to test management that combines test methods, test management, risk assessment and stakeholder management into one integral process, giving test managers, test coordinators, IT project managers, and QA managers a competitive edge in environments where there are numerous unstructured requirements, tough testing schedules and limited resources. This book should be in every test manager's backpack!

Decision Support Systems Springer Science & Business Media

Deteriorating water quality in Europe led to the introduction of the EU Water Framework Directive, one of the most comprehensive EU directives formulated to date. The Directive replaces the previous fragmentary collection of directives and management strategies for water and facilitates integrated policy. An overarching perspective on Europe's water resources will lead the way to the ultimate goal: to create and maintain good water status and sustainable water use. This overarching perspective permeates the new water administrations, which are based on catchment area. The countries of Europe have been divided into water districts, each managed by a separate water authority. The role of the water authorities is to make decisions regarding the environmental goals for water and ensure that these goals are achieved within their individual district. The main tools available are introduction of remediation programmes and management plans, which will place demands on all actors within the catchment area who are using or influencing the water. The ability of these actors to co-operate and collaborate with each other and their implementation of remedial measures in practice will be decisive in achieving the goals. One of the most important actors in catchment areas with intensive cropping are potato and vegetable growers.
