Journal of Animal Science National Academies Press

Project Earth Science: Astronomy, Revised 2nd Edition, involves students in activities that focus on Earth's position in our solar system. How do we measure astronomical distances? How can we look back in time as we gaze across vast distances in space? How would our planet be different without its particular atmosphere and distance to our star? What are the geometries among Earth, the Moon, and the Sun that yield lunar phases and seasons? Students explore these concepts and others in 11 teacher-tested activities.

Inventory of advanced energy technologies and energy conservation research and development, 1976-1978 Springer Science & Business Media

There is no doubt that the field of artificial membrane transport using synthetic ionophores has advanced remarkably in the past 15 years due primarily to the synthesis of new ionophores. Even though the theoretical framework substantially predated this activity, the merging of theory with transport experiment has often been sketchy. The purpose of this outline has been to examine key examples to illustrate the underlying principles and to suggest how experimental variables dominate the results obtained. To a very good approximation the assumption of a "diffusion" regime is often justified, is easily confirmed experimentally and provides a clear framework for exploitation of the inherent selectivity of a given ionophore. Thus for synthetic chemists who wish a "quick and nasty" experiment to examine the question of selectivity, the recipe is clear: a mixture containing all ions of interest in a standard experiment for each ligand of interest using a moderately stirred (100-200 rpm) cell and analysis of the mixture produced on the OUT side of the cell at a fixed, small extent of transport. Together with duplicates and controls, this modest set of experiments will place the results on an unambiguous footing from which clear conclusions about each ionophore's characteristics are readily obtained. For those with more detailed interests in the transport process the demands are correspondingly higher.

Wildland Fire Preparedness University of California Press

In the United States, some populations suffer from far greater disparities in health than others. Those disparities are caused not only by fundamental differences in health status across segments of the population, but also because of inequities in factors that impact health status, so-called determinants of health. Only part of an individual's health status depends on his or her behavior and choice; community-wide problems like poverty, unemployment, poor education, inadequate housing, poor public transportation, interpersonal violence, and decaying neighborhoods also contribute to health inequities, as well as the historic and ongoing interplay of structures, policies, and norms that shape lives. When these factors are not optimal in a community, it does not mean they are intractable: such inequities can be mitigated by social policies that can shape health in powerful ways. *Communities in Action: Pathways to Health Equity* seeks to delineate the causes of and the solutions to health inequities in the United States. This report focuses on what communities can do to promote health equity, what actions are needed by the many and varied stakeholders that are part of communities or support them, as well as the root causes and structural barriers that need to be overcome.

Using Science to Improve the BLM Wild Horse and Burro Program: A Way Forward reviews the science that underpins the Bureau of Land Management's oversight of free-ranging horses and burros on federal public lands in the western United States, concluding that constructive changes could be implemented. The Wild Horse and Burro Program has not used scientifically rigorous methods to estimate the population sizes of horses and burros, to model the effects of management

actions on the animals, or to assess the availability and use of forage on rangelands. Evidence suggests that horse populations are growing by 15 to 20 percent each year, a level that is unsustainable for maintaining healthy horse populations as well as healthy ecosystems. Promising fertility-control methods are available to help limit this population growth, however. In addition, science-based methods exist for improving population estimates, predicting the effects of management practices in order to maintain genetically diverse, healthy populations, and estimating the productivity of rangelands. Greater transparency in how science-based methods are used to inform management decisions may help increase public confidence in the Wild Horse and Burro Program.

Department of the Interior and Related Agencies Appropriations for 1997

Law and Society Today is a problem-oriented survey of sociolegal studies, with a unique emphasis on recent historical and political developments. Whereas other texts focus heavily on criminal procedure, this book foregrounds the significant changes of the 2000s and 2010s, including neoliberalism, migration, multiculturalism, and the large influence of law and economics in law teaching, policy debates, and judicial decision-making. Each chapter presents key concepts, real-world applications, and hypothetical problems that allow students to test comprehension. With an integrated approach to theory and practice and written in an accessible tone, this text helps students recognize the dynamic forces that shape the way the law is constructed and implemented, particularly how law drives social inequality.

California Desert Conservation Area Plan Amendments for the Northern and Eastern Mojave Planning Area NSTA Press

Concepts of Biology is designed for the typical introductory biology course for nonmajors, covering standard scope and sequence requirements. The text includes interesting applications and conveys the major themes of biology, with content that is meaningful and easy to understand. The book is designed to demonstrate biology concepts and to promote scientific literacy.

Proposed Northern and Eastern Mojave Desert Management Plan: Without special title Jones & Bartlett Publishers

Secular Religions: The Key Concepts provides a concise guide to those ideologies, worldviews, and social, political, economic, and cultural phenomena that are most often described as the modern counterparts of traditional religions. Although there are many other terms in use (quasi, pseudo, ersatz, political, civil, etc.), it is "secular religion" that best expresses the problematic nature of all such descriptions, which maintain that modern belief systems and practices are secular on the one hand and religious on the other. Today, the topic is as popular as ever, and secular religions are discovered far and wide. Hence, a critical summary is urgently necessary. The juxtaposed title is itself an expression of ironic distance. The book emphasizes inherent tensions of relevant literature in a critical and informative fashion. The author provides over 100 entries, from abortion to wokeness, as well as a detailed introduction, which gives an overview of the different definitions of "religion" and "secular religion" as well as the history of secular-religious comparisons. The main text reconstructs the argument of several key works on each given topic, while lists of sources for further reading are provided at the end of each entry. This book provides a clear introduction to "secular religions" and will appeal to researchers and students of religious studies, political philosophy, political theology, the history of ideologies, and cultural studies.

This inspiring collection of accounts from educators and students is “an essential resource for all those seeking to build an antiracist school system” (Ibram X. Kendi). Since 2016, the Black Lives Matter at School movement has carved a new path for racial justice in education. A growing coalition of educators, students, parents and others have established an annual week of action during the first week of February. This anthology shares vital lessons that have been learned through this important work. In this volume, Bettina Love makes a powerful case for abolitionist teaching, Brian Jones looks at the historical context of the ongoing struggle for racial justice in education, and prominent teacher union leaders discuss the importance of anti-racism in their unions. Black Lives

Matter at School includes essays, interviews, poems, resolutions, and more from participants across the country who have been building the movement on the ground.
