Many of my aspiring hackers have written to me asking the same thing. "What skills do I need to be a good hacker?" As the hacker is among the most skilled information technology disciplines, it requires a wide knowledge of IT technologies and techniques. To truly be a great hacker, one must master many skills. Don't be discouraged if you don't have all the skills I list here, but rather use this list as a starting ground for what you need to study and master in the near future. Image via Shutterstock This is my overview list of required skills to enter the pantheon of this elite IT profession. I've broken the skills into three categories to help you go from one rung to the other more easily--fundamental, intermediate, and intangible skills--and have included links to related articles on Null Byte for you to get acquainted with. The Fundamental Skills These are the basics that every hacker should know before even trying to hack. Once you have a good grasp on everything in this section, you can move into the intermediary level. 1 Basic Computer Skills It probably goes without saying that to become a hacker you need some basic computer skills. These skills go beyond the ability to create a Word document or cruise the Internet. You need to be able to use the command line in Windows, edit the registry, and set up your networking parameters. Many of these basic skills can be acquired in a basic computer skills course like A+. 2 Networking Skills You need to understand the basics of networking, such as the following. DHCP NAT Subnetting IPv4 IPv6 Public v Private IP DNS Routers and switches VLANs OSI model MAC addressing ARPAs we are often exploiting these technologies, the better you understand how they work, the more successful you will be. Note that I did not write the two guides below, but they are very informative and cover some of the networking basics mentioned above. *Hacker Fundamentals: A Tale of Two Standards The Everyman's Guide to How Network Packets Are Routed* 3 Linux Skills It is extremely critical to develop Linux skills to become a hacker. Nearly all the tools we use as a hacker are developed for Linux and Linux gives us capabilities that we don't have using Windows. If you need

to improve your Linux skills, or you're just getting started with Linux, check out my Linux series for beginners below. *Linux Basics for the Aspiring Hacker* 4 Wireshark or Tcpdump Wireshark is the most widely used sniffer/protocol analyzer, while tcpdump is a command line sniffer/protocol analyzer. Both can be extraordinarily useful in analyzing TCP/IP traffic and attacks. An Intro to Wireshark and the OSI Model Wireshark Filters for Wiretappers 5 Virtualization You need to become proficient in using one of the virtualization software packages such as VirtualBox or VMWare Workstation. Ideally, you need a safe environment to practice your hacks before you take them out in real world. A virtual environment provides you a safe environment to test and refine your hacks before going live with them. 6 Security Concepts & Technologies A good hacker understands security concepts and technologies. The only way to overcome the roadblocks established by the security admins is to be familiar with them. The hacker must understand such things as PKI (public key infrastructure), SSL (secure sockets layer), IDS (intrusion detection system), firewalls, etc. The beginner hacker can acquire many of these skills in a basic security course such as Security+. *How to Read & Write Snort Rules to Evade an IDS Assessment and Support for Basic Computer Skills at Community College Hispanic Serving Institutions in California* Linworth Publishing, Incorporated Guides beginning users through basic PC operations in Microsoft Windows, demonstrating how to print letters, manage finances, shop online, send and receive e-mail, and customize the desktop. This cross-sectional survey study was conducted to determine if California community colleges designated as Hispanic Serving Institutions (HSIs) assess incoming students for basic computer skills, provide learning support for these skills, as well as assess the attitude of administrators towards basic computer skills of incoming students. Prior published research documented the false assumption in higher education incoming students are "digital natives", capable of effectively using technology expected on college campuses; however, there was no research focused on community colleges designated as HSIs. The study adds to the body of literature about the assessment of and support for basic computer skills on college campuses. For purposes of the study, "basic computer skills" were defined in five categories: -The ability to use word processing software (most commonly Microsoft Word); -The ability to use spreadsheet software to prepare charts and graphs (most commonly Microsoft Excel); -The ability to use software for classroom presentations and speeches (most commonly Microsoft PowerPoint); -The ability to navigate the Internet for research; and -The capability of learning and participating in online classrooms using various platforms or software. The participants in this study were administrators in key academic positions representing all 55 community colleges HSIs in the state. All participants in the study held an administrator position at the time of the study. Each participant was asked a series of nine survey research questions, distributed via e-mail. All participants were asked the same questions and responses were electronically recorded and analyzed. The survey determined the following: 1. Community college HSIs in California do not assess incoming students for basic computer skills. 2. Community college HSIs in California have varying academic support for basic computer skills. 3. Basic computer skills courses are not prerequisites for non-computer skill courses or programs. 4. Most California community college HSI administrators believe computer skills are basic college level skills. 5. However, most California community college HSI administrators are

not concerned about the level of basic computer skills of the student body. The responses from participants in the study emphasize the need for institutional change.
