Introducing computers into production engineering has drastically reduced the "artisan skill" content traditionally required in manufacturing processes and replaced it with high-precision, computer-controlled machinery. While this reduces human error and variability in output, it does not eliminate the knowledge required of the professional engineering or shop floor worker. On the contrary, the reverse is true. Managers, engineers, and workers still need to understand the fundamentals while they need to acquire other skills. These highly-regarded authors combine more than 150 years of industrial and academic experience and expertise to provide readers with the fundamentals of the subject, from digital manufacturing with CNC machine tools and FMS up to Industry 4.0, emphasizing the increased importance of automated manufacturing based on computerized systems (CAD, CAM, CAQ, etc.). Features This groundbreaking work introduces readers to CNC fundamentals, followed by a number of chapters which explain how different components are applied in practice. This logical approach is extended to the study of CNC and drives, tooling, flexible manufacturing systems (FMS), and finally to NC-programming, DNC, digital manufacturing, Industry 4.0 and computer integrated manufacturing (CIM). Additional chapters cover industrial robots, additive manufacturing, energy-efficient manufacturing, simulation systems, state of the art of machine integrated measuring systems, and using touch probes and laser beams. Explains the functions and connections of all integrated components.

Beginner's Guide to CNC Machining in Wood Cengage Learning

Before the introduction of automatic machines and automation, industrial manufacturing of machines and their parts for the key industries were made though manually operated machines. Due to this, manufacturers could not make complex profiles or shapes with high accuracy. As a result, the production rate tended to be slow, production costs were very high, rejection rates were high and manufacturers often could not complete tasks on time. Industry was boosted by the introduction of the semi-automatic manufacturing machine, known as the NC machine, which was introduced in the 1950's at the Massachusetts Institute of Technology in the USA. After these NC machine started to be used, typical profiles and complex shapes could get produced more readily, which in turn lead to an improved production rate with higher accuracy. Thereafter, in the 1970's, an even larger revolutionary change was introduced to manufacturing, namely the use of the CNC machine (Computer Numerical Control). Since then, CNC has become the dominant production method in most manufacturing industries, including automotive, aviation, defence, oil and gas, medical, electronics industry, and the optical industry. *Basics of CNC Programming* describes how to design CNC programs, and what cutting parameters are required to make a good manufacturing program. The authors explain about cutting parameters in CNC machines, such as cutting feed, depth of cut, rpm, cutting speed etc., and they also explain the G codes and M codes which are common to CNC. The skill-set of CNC program writing is covered, as well as how to cut material during different operations like straight turning, step turning, taper turning, drilling, chamfering, radius profile, profile turning etc. In so doing, the authors cover the level of CNC programming from basic to industrial format. Drawings and CNC programs to practice on are also included for the reader.

A Comprehensive Guide to Practical CNC Programming Cengage Learning

This comprehensive textbook covers in detail the principal programmable automation technologies used in industry - the building blocks from which all automated manufacturing is developed. It is a one-stop source for developing CNC, robotics, and PLC programming skills, is replete with numerous examples, and it identifies and discusses readily available simulation software to experiment with. The text is primarily intended for undergraduate engineering technology students. Besides, anyone with a technical background and a general understanding of manufacturing and manufacturing processes will find this text useful, as well as to those who wish, simply, to study and understand the use of these technologies The text is organized into four sections. Section One is introductory:

Chapter 1 provides some background on manu-facturing and defines programmable automation. Chapter 2 explains calculation methods used to justify automation expenditures, as motivated by productivity concepts. Section Two covers computer numerical control: Chapter Chapter 3 introduces CNC technology, Chapter 4 discusses CNC programming, and Chapter 5 addresses CNC simulation. Robotics is covered in Section Three: Chapter 6 introduces robotics technology and Chapter 7 goes over both robotics programming and simulation. Section Four addresses PLCs: Chapter 8 introduces PLCs and Chapter 9 covers programming and simulation of PLCs. Finally, Chapter 10 concludes the text with a discussion of how all three technologies are brought together to create programmable automated workstations and work cells.
