This is the third volume of three which will give the reader an insight into the current state of CNC technology with a focus on practical applications. This volume deals with CNC programming. It has been written in conjunction with a major European supplier of controllers in order to give the reader a more consistent and in-depth understanding of the logic used to program such machines. It explains how why and where to program specific features of a part and how to build them up into complete programs. Thus, the reader will learn about the main aspects of the logical structure and compilation of a program. Finally, there is a brief review of some of the typical controllers currently available from both universal and proprietary builders. The author draws on his extensive experience as a practitioner and teacher. The text is thoroughly practical in character and generously illustrated with diagrams and photographs.

Getting Started with CNC Industrial Press Inc.

Introducing computers into production engineering has drastically reduced the "artisan skill" content traditionally required in manufacturing processes and replaced it with high-precision, computer-controlled machinery. While this reduces human error and variability in output, it does not eliminate the knowledge required of the professional engineering or shop floor worker. On the contrary, the reverse is true. Managers, engineers, and workers still need to understand the fundamentals while they need to acquire other skills. These highly-regarded authors combine more than 150 years of industrial and academic experience and expertise to provide readers with the fundamentals of the subject, from digital manufacturing with CNC machine tools and FMS up to Industry 4.0, emphasizing the increased importance of automated manufacturing based on computerized systems (CAD, CAM, CAQ, etc.). Features This groundbreaking work introduces readers to CNC fundamentals, followed by a number of chapters which explain how different components are applied in practice. This logical approach is extended to the study of CNC and drives, tooling, flexible manufacturing systems (FMS), and finally to NC-programming, DNC, digital manufacturing, Industry 4.0 and computer integrated manufacturing (CIM). Additional chapters cover industrial robots, additive manufacturing, energy-efficient manufacturing, simulation systems, state of the art of machine integrated measuring systems, and using touch probes and laser beams. Explains the functions and connections of all integrated components.

The BASICS Handbook is designed to show personnel at all levels within a manufacturing operations environment that, with easy to understand continuous improvement tools, they can make a difference to operational performance where safety, quality, cost, delivery, and people are paramount to business success. The tools and techniques throughout, based upon examples from the author's experience, demonstrate that no matter what industry, they can bring the desired added value. This book will help any manufacturing shop floor add value in terms of quality/cost and

delivery performance. It will also show how using tools and techniques from the "coal face" out will improve process performance by using simple data collection and measurement - not only on outputs, but just as importantly on "critical to quality inputs" such as process parameters and their processing windows - to deliver the desired output KPIs. The power and confidence that this gives to local experts and processing teams enable them to make informed decisions, preventing drifts and non-conforming product: prevention being better than cure. The result of these changes is a tangible cultural impact on the shop floor, raising the level at which operating teams work and improving morale. BASICS will enable staff at all levels to understand their performance measures and produce sustainable results. The book contains practical tools, methods, and techniques that have been tried and tested by the author over a successful 30-year career as a contractor transforming variable processing and inconsistent KPI results.
