Heart Structure and Functions The modest size and weight of the heart give few hints of its incredible strength. Cardiovascular System Anatomy and Physiology: Study Guide ...The cardiovascular system has two distinct circulatory paths: Pulmonary circulation; Systemic circulation; The right side of the heart pumps blood to the lungs (pulmonary circulation). In the lungs blood gets oxygenated from the air sacs. At the same time, carbon dioxide diffuses into the air sacs and is exhaled into the atmosphere. Cardiovascular System - Anatomy & Physiology The cardiovascular system is a closed system if the heart and blood vessels. The heart pumps blood through a closed system of blood vessels. Blood vessels allow blood to circulate to all parts of the body. Arteries usually colored red because oxygen rich, carry blood away from the heart to capillaries within the tissues. Heart Anatomy | Anatomy and Physiology Anatomy and Physiology of Cardiovascular System Tutorial The heart is the pump responsible for maintaining*

adequate circulation of oxygenated blood around the vascular network of the body. *Anatomy and Physiology of Cardiovascular System Tutorial* The inside of the heart (heart cavity) is divided into four chambers – two atria and two ventricles – separated by cardiac valves that regulate the passage of blood. The heart is enclosed in a sac, the pericardium, which protects it and prevents it from over-expanding, anchoring it inside the thorax. *Cardiac system 1: anatomy and physiology | Nursing Times* *Cardiovascular anatomy and physiology* The circulatory system is also called the cardiovascular system, where “cardi” refers to the heart, and “vascular” refers to the blood vessels.
