The Lymphatic System : Anatomy & Physiology The lymphatic system is part of the circulatory system and a vital part of the immune system, comprising a network of lymphatic vessels that carry a clear fluid called lymph (from Latin, *lympha* meaning water) directionally towards the heart. The lymphatic system was first described in the seventeenth century independently by Olaus Rudbeck and Thomas Bartholin. The swelling of lymph nodes during an infection and the transport of lymphocytes via the lymphatic vessels are but two examples of the many connections between these critical organ systems. Introduction to the Lymphatic System Lymphatic System Physiology and Anatomy Lymphatic system functions as an important and integral part of the vascular

system. In addition to the widely-known immune function, one of the most important part of the lymphatic system is a removal of the extra fluid from the soft tissues and transport of the nutrients from the liver and intestine to the systemic circulation.
