100 hrs weeks. Workover Operations The workover begins by killing the well then removing the wellhead and possibly the flow line, then installing a B.O.P commonly known as a blowout preventer, then lifting the tubing hanger from the casing head, thus beginning to pull the completion out of the well. Workover - Wikipedia Workover operations. Workover operations mean the work conducted on wells after the initial well-completion operation for the purpose of maintaining or restoring the productivity of a well. Well completion/well workover means those operations following the drilling of a well that are intended to establish or restore production. sequencing of a workover operation vary from one job to another. They mainly depend on the equipment already installed in the well and their present condition, what job to be done and how the operation is going to proceed in practical terms. Operations may include squeeze cementing, setting plugs (cement or mechanical), retrieving production equipment, and perhaps cutting and pulling casing. Workover costs vary depending on well conditions and regulatory requirements. Workovers - AAPG Wiki Workovers are major operations performed on wells to restore, maintain or improve their production. How it's important to us A efficient well production rate over time strongly depends on the good conditions in which they are maintained.
