Knowledge about the magnitude of the cost of capital invested in an asset and its determinants is essential for the analysis of corporate investment decisions and for assessing profitability. This book provides a clear conceptual understanding of the cost of capital, the characteristics of an asset that influence it, and a critical, comprehensive, and up-to-date evaluation of practical means for estimating its magnitude. It is intended primarily for use by professional managers, but will also be valuable to future managers in advanced capital budgeting courses. The focus of the discussion is on estimation methods that are theoretically sound and consistent with a corporate goal of value creation. Three methods are analyzed in depth: the discounted cash flow model, the capital asset pricing model, and arbitrage pricing theory. For each method, the basic theory is set out in a nontechnical manner and empirical evidence in support of the model is critically reviewed. The bulk of the discussion then focuses on practical means for implementing the methods for decision-making purposes. Later chapters focus on the effects of the debt-supporting characteristics of assets, on the valuation of options embedded in securities, and on the estimation of the cost of capital for evaluating international investments. The final chapter discusses certain aspects of the use of cost of capital in public utility regulation. Care is taken to separate out key issues from more peripheral material through a comprehensive set of supplementary notes.

Written by authors of established texts in this area, this book is a companion volume to the classic The Capital Budgeting Decision. Exploring this key topic in corporate finance the authors examine the complexities of capital budgeting as well as the opportunities to improve the decision process where risk and time are important elements. Containing 'Global Aspects' sections that cover cross-border decision-making, this book also emphasizes the application of capital budgeting techniques to a variety of issues, including the hugely significant 'buy versus lease' decision that cost corporations billions each year. It gives in-depth coverage to: real options - the value of a project must take into consideration the flexibility that it provides management, acknowledging the option of making decisions in the future when more information is available decomposing cash flows - a project consists of many series of cash flows and each series deserves its own specific risk-adjusted discount rate. Decomposing the cash flows of an investment highlights the fact that while managers are generally aware that divisions and projects have different risks, too often they neglect the fact that the cash flow components may also have different risks, with severe consequences on the quality of the decision-making. Designed to assist those making business decisions at all levels, this volume is essential reading for all those working in or studying capital budgeting.

**Capital Budgeting Valuation** Prentice Hall

Capital Budgeting and Divisional Performance Measurement synthesizes recent work on the use of capital budgeting mechanisms to coordinate decentralized investment decisions in multi-division firms with a focus on two-stage investment problems. Divisional managers often have private information about investment profitability that evolves over time and divisional investments can create positive or negative externalities for other divisions at individual investment stages. The authors show that in these circumstances, formal capital budgeting mechanisms that allocate investment costs to divisions via capital charge rates, depreciation schedules, and inter-divisional

cost-sharing rules, can yield divisional performance measures that provide proper two-stage investment incentives. Several recurring themes arise in our analysis. First, positive and negative externalities that arise from divisional investment decisions can cause optimal capital charge rates to deviate substantially from the firm's cost of capital. Second, the optimal inter-divisional cost-sharing rules for shared investments can be approximated by simple rules frequently observed in practice, such as equal cost-sharing or sharing proportional to divisional performance, under

sometimes counter-intuitive circumstances. Third, agency costs can change the divisions' investment decisions beyond the standard underinvestment rationing result in two-stage investment problems and can impact the first and second-stage cost charges quite differently. Finally, the analysis shows very broadly that the key components of a two-stage optimal budgeting mechanism, including capital charge rates and inter-divisional cost-sharing rules, can vary significantly across the two investment stages, even when the investment decisions appear to be similar at each stage.
