In Determination of  
available chlorine in  
hypochlorite solutions by  
direct titration with  
sodium thiosulfate. Virgil  
A. Willson  
Determination  
of available chlorine in  
hypochlorite ... To  
determine the available  
chlorine in the given  
sample of bleaching  
powder by the iodometric  
method. Principle.  
Bleaching powder is  
commonly used as a  
disinfectant. The chlorine  
present in the bleaching  
powder gets reduced with  
time. So, to find the exact  
quantity of bleaching

powder required, the  
amount of available  
chlorine in the sample  
must be found  
out. Determination of  
Available Chlorine in  
Bleaching Powder ... This  
part of ISO 7393 specifies  
an iodometric titration  
method for the  
determination of total  
chlorine in water. The  
method is applicable for  
the measurement of  
concentrations in terms of  
chlorine (Cl<sub>2</sub>), from 0,01  
mmol/l to 0,21 mmol/l  
(0,71 mg/l to 15 mg/l).  
Several substances  
interfere in the

determination (see clause 10).ISO 7393-3:1990(en), Water quality ?  
 Determination of free ...bleaching powder contains 36-38 per cent of available chlorine. Two methods are in common use for the determination of the available chlorine. In the first, the hypochlorite solution or suspension is treated with an excess of a solution of potassium iodide, and  
 Method of Determination of Chlorine in Bleaching Powder ...Free chlorine concentration was

determined using the method described by Willson (1935). Sodium hypochlorite solution was freshly prepared prior to each experiment by diluting 5 ml NaOCl (free...Determination of available chlorine in hypochlorite ...This research work is based on the determination of chlorine content in raw Ajali water, treated reservoir water and Tap water. For each five samples were collected and analyzed using Mohr Method and the result for the average chlorine

contents are 105.79mg/l for the Ajali raw mater, 129.70mg/l for reservoir and tap water is 178.63mg/l.DETERMINATI  
 ON OF CHLORINE CONTENT IN WATERIn this simulated lab exercise, the procedure for determining chlorine in a household bleach using the iodometric method is explained in detail. Every step of the protocol is carried out, from the weighing and dissolution of sodium thiosulfate used as titrant, until the final calculation of the concentration (as g / L of

active chlorine in the sample) using the data of five determinations. Iodometric assay for the determination of chlorine in a ... Again the percentage of available chlorine can be calculated through the concept of normality. The gram equivalent of bleaching powder is equal to the gram equivalent of the standard titrant you have used then calculate the % available chlorine by weight of chlorine/weight of bleaching powder\*100=amount of

available chlorine  
Percent active chlorine - Wikipedia  
The determination of free chlorine in bleach is possible by a redox titration. The most common and successful method for use in high schools involves taking the sample of bleach converting the hypochlorite ion ( $\text{ClO}^-$ ) to iodine ( $\text{I}_2$ ) by the addition of KI and then titrating the iodine with standardized sodium thiosulfate solution.  
ANALYSIS OF BLEACH BY THIOSULFATE TITRATION  
Use the

analytical balance to determine the mass of the apparatus and record in your lab notebook. Add approximately 0.5 grams of bleach to the reaction flask (approx. 10 drops) Reweigh the apparatus (analytical balance) and determine the mass of the bleach sample to the nearest tenth of a milligram .  
Determination of Sodium Hypochlorite in Household Bleach I ...  
The stock solution of sodium hypochlorite with about 5 percent available chlorine is available. As the strength of chlorite

sterilizers decreases on storing it is necessary to check the strength. This method is based on the reaction between available chlorine from hypochlorite solution and acidified potassium iodine solution in which iodine is liberated.
