approximation of curves in the plane and in space, and (ii) singularities of secant maps of immersed surfaces from a geometric perspective. (PDF) Geometric approximation of curves and singularities ... In general, such a projection is a curve whose singularities are self-crossing points and ordinary cusps. Self-crossing points appear when two different points of the curves have the same projection. Ordinary cusps appear when the tangent to the curve is parallel to the direction of projection (that is when the tangent projects on a single point). Cusp (singularity) - Wikipedia In algebraic geometry, the problem of resolution of singularities asks whether every algebraic variety V has a resolution, a non-singular variety W with a proper birational map $W \rightarrow V$. For varieties over fields of characteristic 0 this was proved in Hironaka (1964), while for varieties over fields of characteristic p it is an open problem in dimensions at least 4.
